## **Chapter 1:** Software Requirements Specification (SRS)

# Problem Statement

## Overview

The Construction Industry, particularly civil engineering, involves building and assembling infrastructure. Large-scale construction requires multitasking, and the industry faces increasing project risks and complexity. Long-term contracts and post-construction services present both challenges and opportunities.

**Market Size:** The construction industry is one of the largest globally, valued at approximately 10 trillion USD.

**Economic Impact:** It significantly contributes to national economies and employs a vast workforce.

**Project Complexity:** With growing project sizes and demands for quicker delivery, the coordination between contractors, suppliers, and stakeholders becomes more challenging. Projects often involve multiple disciplines working simultaneously, from initial design to final handover.

**Long-Term Contracts:** The shift towards long-term contracts and post-construction services has created new opportunities for innovation in construction management. However, it also introduces risks related to maintenance and operational costs that must be factored into the initial planning stages.

**Technological Advancements:** With the rise of technology integration such as Building Information Modeling (BIM), drones, and AI, companies are finding new ways to streamline workflows and reduce project timelines, while minimizing waste and error.

## **Purpose**

The Construction Site Management Database is designed to centralize all critical information necessary for managing construction projects. It offers:

Monitoring Tools for measurements, materials (e.g., concrete, steel), and construction designs, ensuring availability and adherence to required standards.

Financial Tracking for costs and budgets to prevent overspending.

Quality Assurance through regular checks, ensuring compliance with construction standards.

Communication & Coordination tools that enhance collaboration among project participants for more organized and timely decision-making.

## **Intended Audience**

1. **Construction Manager:** Oversees the execution of construction projects, ensuring they meet deadlines, budgets, and quality standards.
2. **Construction Accountants:** Manages financial transactions, budget allocations, and audits related to construction projects.
3. **Finance Managers:** Controls financial planning and tracks costs to ensure project profitability and proper resource allocation.
4. **Logistics Managers:** Coordinates the transportation, storage, and supply of materials and equipment for construction sites.
5. **Inventory Managers:** Oversees material availability, procurement, and stock levels to prevent project delays.
6. **Project Analysts:** Provides data-driven insights to improve project efficiency, track performance, and minimize risks.
7. **Architects / Building Designers:** Designs functional, safe, and aesthetically pleasing buildings, integrating structural and material considerations.
8. **Quality Control Analysts / Testers:** Ensures that construction materials and processes meet safety and quality standards through regular inspections.
9. **Construction Workers:** Carries out hands-on construction tasks, implementing project plans under the supervision of site managers.

## Product Scope

The **Product Scope** of our construction site management database includes centralizing all critical information for managing construction projects. This encompasses:

- **Project Management:** Tracking project details, timelines, budgets, and execution phases.
- **Material & Equipment Tracking:** Managing inventory, material suppliers, tool usage, and availability.
- **Financial Oversight:** Monitoring budgets, costs, and payment statuses.
- **Risk & Safety Management:** Tracking accidents, safety protocols, inspections, and risk assessments.
- **Quality Control:** Ensuring compliance through quality checks, standards, and inspections.
- **Collaboration & Communication:** Facilitating coordination between stakeholders, contractors, and workers.

## **Problem Description**

An industry as big as construction requires a proper management system because its complexity can easily be overlooked and can easily get too big to manage.

Tracking the measurements, material like concrete and steel, and construction designs, ensuring everything needed for the project is available on time and that the work meets the required standards becomes really important. In spite of the steady rise of the construction industry and its demand, it remains heavily dependent on manual labor. The construction industry faces challenges that become even more for developing countries.

During our comprehensive fact-finding process aimed at understanding the operations of a construction site, we employed a multi-faceted approach to gather insights into the challenges and intricacies faced by site managers and workers. This investigation included background research, the distribution of a detailed questionnaire, and an in-depth interview with key personnel. The findings provide a clearer understanding of the day-to-day complexities involved in managing a construction site, highlighting both operational and human resource challenges.

Some key challenges are poor productivity, inflation, and rising costs, availability of skilled labor and increased competition, and shrinking profit margins.

One key focus is on estimating costs, setting project budgets, and handling contingencies. It becomes important to use practical methods to ensure that budgets remain on track, and includes strategies for avoiding common pitfalls related to underestimating project costs.

There is a need to implement robust systems to ensure that construction meets required standards without excessive rework or delays.

From the background readings, it became evident that the management of construction projects involves a delicate balance of planning, coordination, and execution. Site managers are tasked with overseeing project timelines, resource allocation, and adherence to safety regulations, while also ensuring smooth communication among different stakeholders. The complexity is further heightened by the need to anticipate and mitigate unforeseen issues, such as equipment malfunctions, supply delays, and weather disruptions.

These factors contribute to the multifaceted nature of the role, requiring strong leadership and problem-solving abilities.

An integral part is in-depth discussions on organizing project teams, outlining responsibilities, and maintaining effective communication across stakeholders. Additionally, it emphasizes the importance of proper documentation, including contracts, project reports, etc.

There are safety concerns in construction—fall hazards. It's important to identify the primary causes of falls on construction sites and outline the most effective strategies to mitigate these risks. Factors contributing to falls include poor site conditions, lack of proper safety equipment, insufficient training, and inadequate safety protocols. Construction workers are frequently exposed to heights and unstable structures, leading to a higher risk of falls.

Effective safety management systems, regular inspections, and training are essential to prevent accidents and ensure worker well-being. Risk management is also crucial, as construction projects are vulnerable to unexpected delays and cost overruns.

Inventory Management systems consist of different tasks like finding suitable materials, procurement process of those materials, transportation. Materials on construction sites cost around 50-60% of the total cost of the project, so it becomes very crucial to handle the materials methodically.

Construction projects are vulnerable to unexpected risks, which can cause delays, cost overruns, or even project failure if not managed properly. It means a structured approach for identifying and assessing risks, including steps like knowledge acquisition, team selection, and verification.

# Requirement Collection

## Background Readings

### 1. Information Technology in Construction: Domain Definition and Research Issues

- **Type:** Research Journal
- **Author:** Bo-Christer Björk
- **Publication:** *International Journal of Computer Integrated Design and Construction* (May 1999)
- **Citation:** Information technology in construction: domain definition and research issues

### Key Points:

- The author, Mr. Björk, believes there is a need for a discussion of 'Information Technology in Construction' as a discipline, possibly leading to some degree of consensus among leading researchers on the scope and scientific methodology of the discipline.
- In spite of the steady rise of the construction industry and its demand, it remains heavily dependent on manual labor. The construction industry faces challenges that become even more for developing countries.
- Some key challenges are poor productivity, inflation, and rising costs, availability of skilled labor and increased competition, and shrinking profit margins.
- An abstract formalized model of information management in construction is proposed as the basis for a definition of the domain and boundaries of ITC.

## 2. Project Management in Construction (7th Edition)

- **Type:** Research Journal
- **Author:** Sidney M Levy
- **Citation:** *Levy, Sidney (2018). Project management in construction (7th ed.). McGraw-Hill Education.*

### Key Points:

- The book is a comprehensive guide aimed at professionals involved in construction project management. It focuses on the core goal of controlling **quality, schedules, and costs** throughout the life cycle of a project.
- **Complex Construction Processes:** It provides insight into how construction projects, which are typically complex and multifaceted, can be managed more efficiently by following well-defined processes.
- **Estimating and Budgeting:** One key focus is on **estimating costs**, setting project budgets, and handling contingencies. The book discusses practical methods to ensure that budgets remain on track, and includes strategies for avoiding common pitfalls related to underestimating project costs.
- **Quality Control and Assurance:** A significant portion of the book is dedicated to **quality assurance** and **quality control** (QA/QC). These sections guide the reader on implementing robust systems to ensure that construction meets required standards without excessive rework or delays.
- **Team Management and Documentation:** Levy also provides in-depth discussions on organizing project teams, outlining responsibilities, and maintaining effective communication across stakeholders. Additionally, it emphasizes the importance of **proper documentation**, including contracts, project reports, etc.

### 3. An Appraisal into the Potential Application of Big Data in the Construction Industry

- **Type:** Research Journal
- **Authors:** Siti Aisyah Ismail, Shamsulhadi Bandi, Zafira Nadia Maaz
- **Publication:** *International Journal of Built Environment and Sustainability* (April 2018)
  
- **Key Points:**
  - **Big Data in Construction:** The paper explores how **Big Data** can be leveraged in the construction industry to improve decision-making, project management, and overall efficiency.
  - **Data-Driven Insights:** With the use of Big Data analytics, construction managers can gain real-time insights into various project metrics such as resource allocation, equipment usage, and task performance, leading to improved planning and execution.
  - **Predictive Maintenance:** The integration of Big Data allows for **predictive maintenance** of machinery and equipment, reducing downtime and preventing costly repairs by identifying potential failures before they occur.
  - **Risk Management:** Big Data enhances **risk management** by enabling better identification of potential risks based on historical data, which helps in the formulation of more accurate risk mitigation strategies.
  - **Challenges in Data Collection:** Despite the benefits, the research highlights several challenges in data collection on construction sites, including inconsistent data sources, integration difficulties, and the need for skilled personnel to manage data effectively.
  - **Future Applications:** The paper calls for further research into how **Machine Learning** and technologies can be applied in construction automating tasks like scheduling, risk prediction, and resource management.

#### 4. Causes of Fall Hazards in Construction Site Management

- **Type:** Research Paper
- **Authors:** Chong Hui Liy, Siti Halipah Ibrahim, Rohaida Affandi, Nor Azalina Rosli, Mohd Nasrun Mohd Nawi
- **Publication:** *International Review of Management and Marketing* (October 2016)
- **Key Points:**
  - **Overview of Fall Hazards:** This paper addresses one of the most serious safety concerns in construction—**fall hazards**. It identifies the primary causes of falls on construction sites and outlines the most effective strategies to mitigate these risks.
  - **Risk Factors:** Factors contributing to falls include poor site conditions, lack of proper safety equipment, insufficient training, and inadequate safety protocols. Construction workers are frequently exposed to heights and unstable structures, leading to a higher risk of falls.
  - **Regulations and Enforcement:** The study emphasizes the importance of **enforcing safety regulations** and standards. It highlights the need for project managers to strictly implement safety measures, conduct regular inspections, and ensure compliance with legal safety requirements.
  - **Training and Awareness:** One of the key recommendations is to provide **comprehensive training** for workers on how to use safety equipment and follow fall-prevention protocols. Regular safety drills and **awareness campaigns** can also help reduce the occurrence of falls.
  - **Effective Safety Systems:** The paper advocates for implementing an **effective safety management system** that includes frequent workplace inspections, monitoring of potential hazards, and a system for reporting and addressing safety concerns.

## 5. Inventory Management in Construction Industry

- **Type:** Research Paper
- **Authors:** Harsh Malik and Pushpendra Kumar Sharma
- **Originally Published :** May, 2022
- **Citation :** Malik, H., & Sharma, P. K. (2022). Inventory Management in Construction Industry. *IOSR J. Eng*, 12(5), 26-33.
- **Key Points:**
  - It's really important at a construction site that all the required raw materials are readily available on time and meet the required standards. Inventory Management systems consist of different tasks like finding suitable materials, procurement process of those materials, transportation. Materials on construction sites cost around 50-60% of the total cost of the project, so it becomes very crucial to handle the materials methodically.
  - The main objective of this paper is to study the existing research on inventory management in the Indian construction industry to observe the importance of inventory management and different costs associated with.
  - This research paper looks into all the studies that have been done around the topic of inventory management and provides us with findings with each one of them.

## 6. The Controlling Influences on Effective Risk Identification and Assessment for Construction Design Management

- **Type:** Research Paper
- **Author:** Robert J. Chapman
- **Publication:** *International Journal of Project Management* (April 2001)
- **Citation :** Chapman, R. J. (2001). The controlling influences on effective risk identification and assessment for construction design management. *International journal of project management*, 19(3), 147-160.
- **Key Points:**
  - **Risk in Construction Projects:** Construction projects are vulnerable to unexpected risks, which can cause delays, cost overruns, or even project failure if not managed properly.
  - **Risk Identification Process :** The paper outlines a structured approach for identifying and assessing risks, including steps like **knowledge acquisition, team selection, and verification.**
  - **Consequences of Poor Risk Management :** Failure to manage risks can result in major threats to project goals, affecting both financial and operational outcomes.
  - **Recommendations :** Emphasizes a **comprehensive risk management strategy** that ensures thorough risk assessment and effective communication among stakeholders to minimize risks.

## 7. Coordinated construction logistics: an innovation perspective

- **Type:** Research Paper
- **Authors:** S Hedborg Bengtsson
- **Originally Published :** November, 2018
- **Citation :** Hedborg Bengtsson, S. (2018). Coordinated construction logistics: an innovation perspective. *Construction Management and Economics*, 37(5)
- **Key Points:**
  - All the logistics for a construction firm be it for a project or group of projects has to be coordinated in order to get full efficiency out of all the resources.
  - Construction projects are complex, it was concluded 50 years ago in the study of distribution of house-building material, saying that "*the number of possible permutations and combinations of specific places and entities is enormous, even for one product*". This complexity is often used in supply chain management as an argument for construction projects to implement more structured and coordinated construction logistics models.
  - This calls the need for different models for different requirements. This paper formulates by categorizing the explored models as different types of innovation, the main practical implication is for management to understand that, depending on context and number of involved actors, different models will suit different organizations, projects and systems. Where an inter-organizational context seems to require unified management, actors engagement and clear directives. If these factors are not present, the innovation runs the risk of not being embedded.

## 8. Big Data in the construction industry: A review of present status, opportunities, and future trends

- **Type:** Research Article
- **Author:** Muhammad Bilala, Lukumon O. Oyedele and More
- **Originally Published :** July, 2016
- **Citation :** [Big Data in the construction industry: A review of present status, opportunities, and future trends \(sciencedirectassets.com\)](https://www.sciencedirect.com/science/article/pii/S2352312616300011)

### Key Points:

- **Key-value:** This is the simplest data model to store unstructured data. However, the underlying data is not self-describing.
- **Document:** This data model is suitable for storing self describing entities. However, the storage of this model can be inefficient.
- **Columnar:** This data model favors the storage of sparse data sets, grouped sub-columns, and aggregated columns.
- **Graph:** This is a relatively new data model that supports relationship traversal over a huge dataset of property-graphs. Graph databases are getting more popular than other data models,

### The Key Points from the Conclusion of the paper

- **Big Data Potential:** Big Data has significant potential to revolutionize the construction industry by improving efficiency and decision-making.
- **Current Adoption:** The adoption of Big Data technologies in the construction industry is still in its early stages and lags behind other industries.
- **Challenges:** There are several challenges to Big Data adoption, including data integration, data quality, and the need for skilled personnel.
- **Opportunities:** Big Data can provide opportunities for resource optimization, waste reduction, and enhanced project management.
- **Machine Learning:** Machine learning techniques can be applied

to various construction processes for predictive analytics and automation.

- **Data Analytics:** Advanced data analytics can help in identifying patterns and trends, leading to better decision-making.
- **Interdisciplinary Approach:** An interdisciplinary approach is essential for the successful implementation of Big Data in construction.
- **Future Research:** There is a need for more research to address the open issues and explore the full potential of Big Data in construction.
- **Technological Advancements:** Continuous technological advancements are necessary to overcome the current limitations and enhance Big Data applications.
- **Collaboration:** Collaboration between academia, industry, and government is crucial for the successful adoption of Big Data technologies in the construction industry.

## 9. Projecting capitalism: a history of the internationalization of the Construction Industry

- **Type:** Book
- **Author:** Marc Linder
- **Originally Published :** 1994
- **Citation :** Projecting capitalism: a history of the internationalization of the construction industry - Projecting capitalism: a history of the internationalization of t - University of Iowa (uiowa.edu)

### Key Points:

- **Historical Context:** The construction industry has long been a cornerstone of economic development, dating back to ancient civilizations. Over time, it has evolved from small-scale, localized operations to a highly complex and internationalized sector. This transformation was driven by technological advancements, economic demands, and the need for infrastructure to support growing populations and industries.
- **Internationalization:** The internationalization of the construction industry began in earnest during the 19th and 20th centuries. European and American companies started to take on projects in foreign countries, driven by the pursuit of new markets and resources.
- **Modern Developments:** In recent decades, the construction industry has continued to globalize, with companies from emerging economies also entering the international arena. The industry now faces new challenges and opportunities, including sustainability concerns, technological innovations like Building Information Modeling (BIM), and the need for resilient infrastructure in the face of climate change.

## 10. Factors Influencing Construction Ergonomic Performance in India

- **Type:** Research Paper
- **Authors:** Ratri Parida, Pradip Kumar Ray
- **Publication:** *Procedia Manufacturing* (2015)
- **Citation :** [Factors Influencing Construction Ergonomic Performance in India - ScienceDirect](#)

### Key Points:

- **Ergonomic Performance:** Construction workers in India often face poor working conditions, leading to injuries that impact productivity. The paper focuses on **ergonomic issues** related to man-machine interaction.
- **Factors Impacting Performance:** The study identified 30 critical factors influencing ergonomic performance, classified into three categories:
  - **Human/Labor-Related Factors:** Includes body joint discomfort in masons, helpers, and carpenters.
  - **Task-Related Factors:** Repetitive work, lack of rest, and awkward postures.
  - **Equipment-Related Factors:** Difficulty handling heavy tools and improper tool design.
- **Survey Analysis:** Based on a survey of 220 construction workers, the **Relative Importance Index (RII)** was used to rank the factors by their impact on performance.
- **Recommendations:** The study suggests applying ergonomic principles to reduce **musculoskeletal disorders** (MSDs) and improve overall safety and comfort on construction sites.

# Interview

## Skyline Constructions: Interview Plan

**Project:** Caledonia Avenue

**Project Reference:** SC/RC/2024/19

**Participants:** Darsh Jain (Skyline Constructions, Caledonia Site Manager)

Smit Thakkar (Interviewer)

Mann Shrimali (Interviewer)

**Date:** 10/09/2024

**Time:** 11 am

**Duration:** 60 minutes

**Place:** Darsh's Office

### **Purpose of Interview:**

Meeting the construction site project manager to get the idea of what processes go into a large scale construction project and what are the minimum requirements of materials and labor force and other overlooked things that go into a project finishing efficiently..

### **Agenda:**

First hand insights from an experienced personal about the ins and outs of all the complexities that go into a big project.

-> How the requirement of raw materials is managed throughout the project.

-> How the quality assurance is carried out.

-> How they ensure better coordination and decision making.

### **Documents to be brought to the interview:**

Any document relating to a project similar like the one in question  
Journal findings about planning of a construction project.

## **Skyline Constructions: Interview Summary**

**Project:** Caledonia Avenue

**Project Reference:** SC/RC/2024/19

**Participants:** Darsh Jain (Skyline Constructions, Caledonia Site Manager)

Smit Thakkar (Interviewer)

Mann Shrimali (Interviewer)

**Date:** 10/09/2024    **Time:** 11 am

**Duration:** 60 minutes    **Place:** Darsh's Office

### **Purpose of Interview:**

Meeting the construction site project manager to get the idea of what processes go into a large scale construction project and what are the minimum requirements of materials and labor force and other overlooked things that go into a project finishing efficiently..

### **Interview Summary**

1. Raw material requirements are projected before the project starts and it's usually right because they take all the factors into account.
2. No advanced construction site management database in place as such, though an informal and fairly effective system does exist.
3. The finance and budget accounts are managed professionally.
4. Hierarchical type of management functions at the site. All the workers report to their immediate boss.
5. Regular inspections of the site by the project manager and site manager are done to keep the quality at the standard level.
6. The schedule is regularly updated to keep the initial desired timeline intact.
7. A system is in place to ensure there isn't overspending.

## Questionnaire

---

1. How Many Days a Week do you work on a Construction Site?  
A. 1-2 Days      B. 3-4 Days      C. 4-5 Days      D. 6-7 Days
  
2. How Would You Describe the Safety Measures on the Construction Site?  
A. Satisfactory      B. Somewhat Satisfied      C. Needs Improvement  
D. Hazardous
  
3. How would you Describe your Raw Material Supply and Quantity?  
A. Adequate Quantity      B. More than Necessary      C. Less than Requirement  
D. Always Insufficient
  
4. How would you Describe the Quality of the Raw Materials?  
A. Best Quality      B. Standard Quality      C. Poor Quality      D. Hazardous
  
5. How would you Describe the availability of the Construction Worker?  
A. Adequate Quantity      B. More than Necessary      C. Less than Requirement  
D. Always Insufficient
  
6. What is the frequency of Safety Checks and Drills on the Site?  
A. Daily      B. Frequent      C. Weekly      D. Rarely
  
7. What Type of Projects do you work on often?  
A. Commercial      B. Government      C. Private      D. Personal
  
8. How would you Describe your Wages and the frequency of Bonuses?  
A. Satisfactory      B. Somewhat Satisfied      C. Needs Improvement  
D. Immediate Raise Required
  
9. What Improvements would you like to suggest regarding the current inspection system?

-----  
-----

Your Name \_\_\_\_\_

Thank you for completing this questionnaire

---

## Observations

During our comprehensive fact-finding process aimed at understanding the operations of a construction site, we employed a multi-faceted approach to gather insights into the challenges and intricacies faced by site managers and workers. This investigation included background research, the distribution of a detailed questionnaire, and an in-depth interview with key personnel. The findings provide a clearer understanding of the day-to-day complexities involved in managing a construction site, highlighting both operational and human resource challenges.

From the **background readings**, it became evident that the management of construction projects involves a delicate balance of planning, coordination, and execution. Site managers are tasked with overseeing project timelines, resource allocation, and adherence to safety regulations, while also ensuring smooth communication among different stakeholders. The complexity is further heightened by the need to anticipate and mitigate unforeseen issues, such as equipment malfunctions, supply delays, and weather disruptions. These factors contribute to the multifaceted nature of the role, requiring strong leadership and problem-solving abilities.

## **Here is an observation Summary from Background Readings on Construction Site Management:**

The background readings provide a comprehensive view of the challenges, advancements, and practices involved in managing construction sites. Several key themes emerge, each contributing to a deeper understanding of the complexities of construction site management.

### **A. Project Complexity and Coordination:**

The construction industry faces growing complexity due to larger project sizes and the need for quicker delivery. This complexity is amplified by the coordination required among contractors, suppliers, and stakeholders. Different disciplines often work simultaneously from initial design to final handover, requiring efficient management strategies. The shift towards long-term contracts adds another layer of complexity, as post-construction services and maintenance must be considered early in project planning.

### **B. Technological Integration:**

Technological advancements such as Building Information Modeling (BIM), drones, AI, and Big Data are reshaping the construction industry. These innovations streamline workflows, reduce errors, and improve decision-making. However, the adoption of these technologies, especially Big Data, is still in its early stages, and the industry faces challenges like data integration, quality issues, and the need for skilled personnel. Nevertheless, these tools hold immense potential for improving efficiency, resource optimization, and predictive maintenance.

### **C. Safety and Risk Management:**

Safety is a critical concern in construction, particularly regarding fall hazards and the need for ergonomic improvements. Effective safety management systems, regular inspections, and training are essential to prevent accidents and ensure worker well-being. Risk management is also crucial, as construction projects are vulnerable to unexpected

delays and cost overruns. Proper risk identification and assessment strategies can help mitigate these risks, ensuring projects stay on track and within budget.

#### **D. Inventory and Financial Management:**

Managing inventory and controlling project costs are central to successful construction site management. Materials often represent a significant portion of the total project cost, making it essential to handle procurement and transportation efficiently. Financial tracking tools are critical for preventing overspending and ensuring that budgets are maintained throughout the project lifecycle. Quality control and assurance mechanisms further ensure that materials and processes meet required standards, minimizing rework and delays.

#### **E. Human Resource and Team Management:**

The importance of team management, communication, and documentation is highlighted in several readings. Organizing project teams, clearly defining responsibilities, and maintaining effective communication across stakeholders are vital for smooth project execution. Additionally, ergonomic performance, particularly in developing countries, is a growing concern, with poor working conditions and equipment design impacting productivity and worker health.

In conclusion, the readings highlight the dynamic nature of construction site management, emphasizing the need for robust management strategies, technological integration, risk mitigation, and a strong focus on safety and quality to address the industry's evolving challenges.

---

The **questionnaire responses** from workers revealed a range of operational challenges, including task allocation, workload management, and the physical demands of the job. Workers frequently highlighted the importance of effective communication between management and labor teams, emphasizing that clear instructions and real-time updates are critical for efficient site operations. Additionally, safety concerns were a recurring theme, with many workers expressing a desire for more frequent safety briefings and improved access to protective gear.

### **Here is the observation Summary from Questionnaire and Workers Responses:**

The questionnaire results from 50 construction workers provide valuable insights into the current working conditions on construction sites, including safety measures, raw material management, and workforce availability. Key observations from the responses include:

#### **1. Working Hours:**

- A significant portion of workers (75%) reported working 6-7 days per week, indicating long work hours and potentially high workloads. Only a small percentage work less than 4 days a week (15%).

#### **2. Safety Measures:**

- While 45% of workers are "Somewhat Satisfied" with the safety measures, 40% feel that improvements are necessary, with 10% considering the conditions "Hazardous." This suggests safety is a concern for many workers, though not all find it inadequate.

#### **3. Raw Material Supply and Quality:**

- The majority (60%) reported that raw materials are often in "Less than Requirement" quantities, indicating potential delays or inefficiencies in material supply.

- In terms of quality, over half (55%) described the materials as "Standard Quality," while 25% rated them as "Poor" and 10% as "Hazardous." This raises concerns about the materials being used on site, which may affect the overall construction quality.

**4. Availability of Workers:**

- Most workers (70%) find the availability of workers "Adequate," indicating that workforce levels are generally satisfactory. However, 20% reported workforce shortages, which could affect project timelines.

**5. Safety Checks and Drills:**

- Safety checks are typically performed on a "Weekly" basis (60%), but only 20% experience "Daily" or "Frequent" checks. Given that 20% report "Rare" safety checks, there is a need to increase the frequency of safety inspections.

**6. Project Types:**

- Half of the workers are involved in "Commercial" projects, with a smaller proportion working on "Government" (20%), "Private" (20%), and "Personal" (10%) projects. This suggests that most workers are engaged in larger-scale commercial construction.

**7. Wages and Bonuses:**

- A significant number (50%) are only "Somewhat Satisfied" with their wages and bonuses, while 30% feel that improvements are necessary. This suggests wage dissatisfaction is common and may need to be addressed.

**8. Inspection and Safety Protocol Improvements:**

- Workers recommended increasing the frequency of inspections, improving immediate hazard reporting, and enhancing training for safety protocols. These suggestions align with the perception of inadequate safety measures.

**Conclusion:**

The responses indicate that while workers are managing heavy workloads and generally find the workforce availability adequate, there are concerns about raw material supply, safety practices, and compensation. The feedback highlights the need for better safety management, more frequent inspections, and improved raw material handling to enhance overall construction site efficiency and worker satisfaction.

---

Finally, **the interview with a site manager** provided valuable insights into the leadership perspective. The manager emphasized the constant pressure to maintain project timelines while balancing budget constraints and labor availability. Managing the workforce was identified as one of the most complex aspects of the job, especially in coordinating various subcontractors and ensuring that each team is aligned with the project's overall objectives. Furthermore, the need for real-time problem-solving and decision-making was underscored as a crucial skill in the dynamic and often unpredictable environment of a construction site.

### **Observation Summary from Interview with Construction Site Project Manager**

The interview with the construction site project manager provided important insights into the management of large-scale construction projects, focusing on the processes, requirements, and strategies that contribute to project efficiency. Key observations include:

#### **1. Raw Material Management:**

- Raw material needs are thoroughly projected before the project starts, and the planning generally proves accurate due to the inclusion of all relevant factors. This preemptive approach helps avoid shortages or delays.
- However, there is no advanced construction site management database in place. Instead, the site relies on an informal system that, while effective, may lack the structure of a more formalized system for monitoring materials and progress.

#### **2. Financial and Budget Management:**

- The financial aspects of the project, including budget and spending, are handled professionally, with systems in place to prevent overspending. This suggests that financial control is a priority, helping maintain project cost-efficiency.

### **3. Workforce Management:**

- A hierarchical management structure is in place at the site, with workers reporting to their immediate supervisors. This tiered structure helps streamline decision-making and ensures that issues are escalated appropriately. This structure likely contributes to improved coordination and communication on the site.

### **4. Site Inspections and Quality Assurance:**

- Regular site inspections by both the project manager and the site manager are conducted to maintain quality control. This suggests a proactive approach to quality assurance, ensuring the project adheres to the necessary standards throughout its duration.

- While inspections are carried out, the absence of a formalized site management system could leave room for missed details or less optimal data tracking.

### **5. Timeline and Scheduling:**

- The project schedule is updated regularly to ensure that the project stays on track with the initial timeline. This indicates that time management and adherence to the project timeline are closely monitored, preventing delays.

### **6. Coordination and Decision-Making:**

- The project uses a system that facilitates coordination and decision-making. This system, while not necessarily formal, appears to help manage both human and material resources efficiently, reducing miscommunication and keeping the project on track.

### **Conclusion:**

The interview revealed that although the project relies on some informal systems, there is a clear focus on pre-project planning, quality assurance, and financial management, which helps keep projects efficient. However, the lack of an advanced construction management database could present challenges as the project grows in complexity. The hierarchical management style, regular site inspections, and schedule updates further contribute to effective project coordination and timely completion.

These findings illustrate the interconnected challenges faced by both site managers and workers, highlighting the need for efficient management strategies and open lines of communication to ensure the successful completion of construction projects.

---

## Fact Finding Chart

<b>Objective</b>	<b>Technique</b>	<b>Subject(s)</b>	<b>Time Commitment</b>
Getting the Overview of the Construction Industry and its domain	Background Reading	Research Papers, Journals	8-12 Hours
Understanding the Scope of The Construction Domain	Background Reading	Research Papers, Journals	6-8 Hours
Gathering Technical aspects of a single Construction Project	Site Visitation	Skyline Industries	3-4 Hours
Learning about the different roles of personnels involved in Construction	Interview	1 Site Manager, 2 Construction Workers	3 Hours
To Find Out the Difficulties faced by the Construction Personnels	Questionnaire	1 Contractor , 50 On-Site Workers	2 Hours

## Requirement List

### **Combined requirements gathered from observations:**

#### **1. Raw Material Management:**

- Ensure accurate projections and maintain adequate, high-quality material supply throughout the project.

#### **2. Construction Site Management:**

- Implement a formal database system for tracking materials, labor, timelines, and spending with real-time updates.

#### **3. Safety Measures:**

- Enhance safety protocols with more frequent inspections, drills, and an immediate hazard reporting system.

#### **4. Labor Force:**

- Maintain an adequate workforce and continue hierarchical management for effective coordination.

#### **5. Scheduling:**

- Regularly update the project schedule to adhere to timelines and prevent delays.

#### **6. Financial Management:**

- Ensure professional financial oversight and cost control to avoid overspending.

#### **7. Quality Assurance:**

- Conduct regular inspections and introduce a formal quality management system.

#### **8. Project-Specific Planning:**

- Tailor material and labor planning based on the project type (commercial, government, or private).

**Key Areas for Improvement:**

1. Increased Safety Frequency: More frequent and comprehensive safety inspections and drills.
2. Enhanced Inspection System: Develop a system that allows more regular and detailed inspections, with immediate feedback on potential issues.
3. Improved Raw Material Supply: Ensure that raw materials are always supplied in the required quantity and quality to meet the project needs.

This combined set of requirements highlights the need for a more structured management approach in several areas to improve project efficiency, safety, and quality control.

## User Privileges

1. **Construction Manager:** Oversees the execution of construction projects, ensuring they meet deadlines, budgets, and quality standards.
2. **Construction Accountants:** Manages financial transactions, budget allocations, and audits related to construction projects.
3. **Finance Managers:** Controls financial planning and tracks costs to ensure project profitability and proper resource allocation.
4. **Logistics Managers:** Coordinates the transportation, storage, and supply of materials and equipment for construction sites.
5. **Inventory Managers:** Oversees material availability, procurement, and stock levels to prevent project delays.
6. **Project Analysts:** Provides data-driven insights to improve project efficiency, track performance, and minimize risks.
7. **Architects / Building Designers:** Designs functional, safe, and aesthetically pleasing buildings, integrating structural and material considerations.
8. **Quality Control Analysts / Testers:** Ensures that construction materials and processes meet safety and quality standards through regular inspections.
9. **Construction Workers:** Carries out hands-on construction tasks, implementing project plans under the supervision of site managers

## User Class and Privileges Table

User Role	Entity Access	Privileges
Construction Manager	Projects, Accidents, Risk Management, Safety Management, Monitoring Tools	Full CRUD (Create, Read, Update, Delete) access to all project-related data, risk management, and safety
Construction Accountants	Budgets, Costs, Contracts, Finance Management	View and update budgets, financial reports, costs, and payment statuses
Finance Managers	Budgets, Costs, Contracts, Financial Reports	Full access to all financial data, including budget allocation, tracking overruns, and financial planning
Logistics Managers	Materials, Equipment, Suppliers, Transportation, Inventory Management	Update material supply, handle delivery schedules, monitor stock levels, and track equipment logistics
Inventory Managers	Materials, Equipment, Inventory Management	Monitor inventory, manage suppliers, and ensure availability of materials
Project Analysts	Projects, Costs, Risk Management, Quality Assurance	Analyze project performance, view costs, inspect quality standards, and report risks
Architects / Building Designers	Construction Designs, Monitoring Tools, Documentation, Standards	Access design data, update monitoring tools, review compliance with standards
Quality Control Analysts	Quality Assurance, Inspections, Materials, Standards	View and update inspection results, verify material compliance, and schedule follow-ups
Construction Workers	Safety Management, Accidents, Site Conditions	View safety protocols, report accidents, update worksite conditions, and track assigned tasks

## Rejected Noun Reason Table

Noun	Reject Reason
Abilities	Attribute (better associated with roles or skills)
Approach	Vague (unclear as an entity)
Architects / Building Designers	Duplicate (covered by "Architects")
Audience	Irrelevant (outside the system's focus)
Balance	Vague (too abstract)
Complexities	Duplicate
Complexity	Attribute (better as an attribute for tasks/projects)
Comprehensive fact-finding Process	Association (a process, not an entity)
Construction	General (too broad as a noun)
Construction Industry	Duplicate (already covered in truncated list)
Construction Projects	Duplicate (already covered by "Project" or "Projects")
Delivery	General (too vague for specific tracking)
Discussions	Association (represents communication between entities)
Focus	Vague (unclear application as an entity)
Human Resource Challenges	Attribute (better as an issue or challenge)
Importance	Vague (too abstract as an entity)
Integration	Association (represents relationships between systems)
Interview	Association (related to human interaction)
Intricacies	Attribute (can be better described as part of processes)
Malfunctions	Attribute (related to equipment)
Measurements	Attribute (better suited to specific attributes)
Multi-faceted Approach	Vague (unclear as an entity)
Multi-faceted Nature	Vague (unclear as an entity)

National Economies	Irrelevant (not part of the construction site scope)
Poor Productivity	Attribute (related to workforce performance)
Practical Methods	Attribute (better described as part of strategies)
Primary Causes	Attribute (associated with incidents or safety)
Process	General (too vague)
Project	Duplicate (already covered in truncated list)
Project Budgets	Duplicate (already covered by "Budgets")
Project Teams	Duplicate (covered under "Teams" or "Stakeholders")
Protocols	Duplicate (already covered by "Safety Protocols")
Quality Control Analysts / Testers	Duplicate (covered by "Quality Control Analysts")
Resource	Attribute (better as "Resource Allocation")
Resource Allocation	Attribute (describes resource management)
Robust Systems	Attribute (part of system attributes)
Site Conditions	Attribute (related to site attributes or risks)
Strategies	Association (represents planning and actions)
Structures	General (too broad in construction context)
Tasks	General (too vague as an entity)
Unexpected Risks	Duplicate (already covered by "Risks")
Worker	Irrelevant (too general, better as "Construction Workers")
civil engineer	Irrelevant (specific to a job role)
collaboration	Association (describes teamwork and coordination)
companies	General (too broad, can be part of stakeholders)
complexity	Attribute (better as an attribute for projects)
construction standards	Duplicate (already covered by "Standards")
database	General (too broad for a specific entity)
infrastructure	General (too broad)
largest	Vague (unclear as a meaningful entity)
participants	Irrelevant (better categorized as stakeholders)
pitfalls	Attribute (related to risks or challenges)

project	Duplicate (already covered in truncated list)
purpose	Vague (unclear representation)
regular checks	Association (represents actions for quality control)
timelines	Duplicate (already covered by "timelines")
track	Vague (unclear as an entity)
workforce	Duplicate (already covered in truncated list)

## Finalized Candidate Entity, Attribute, Relationship Set Table

Entity (Finalized)	Attribute Set (Finalized)	Relationship Set (Finalized)
Projects Table	ProjectID (PK), ProjectName, StartDate, EndDate, ClientName, Location, Status (Ongoing, Completed, etc.)	Leads coordination, Oversee costs, Manage quality assurance
Materials Table	MaterialID (PK), MaterialName, ProjectID (FK), Quantity, Unit, AvailabilityStatus	Linked to Projects, Used in quality checks
Monitoring Tools Table	ToolID (PK), ToolName, MeasurementType, ProjectID (FK), MeasurementValue, Unit	Track project measurements
Costs & Budgets Table	CostID (PK), ProjectID (FK), BudgetedCost, ActualCost, Category, Date	Estimate and track project costs
Quality Assurance Table	CheckID (PK), ProjectID (FK), MaterialID (FK), DateOfCheck, ComplianceStatus, InspectorName	Perform quality checks
Participants Table	ParticipantID (PK), Name, Role, ProjectID (FK), ContactInfo	Participate in and manage projects
Communication Table	CommunicationID (PK), ProjectID (FK), Date, ParticipantID (FK), Message, Status (Open, Resolved)	Manage coordination, Track communication activities

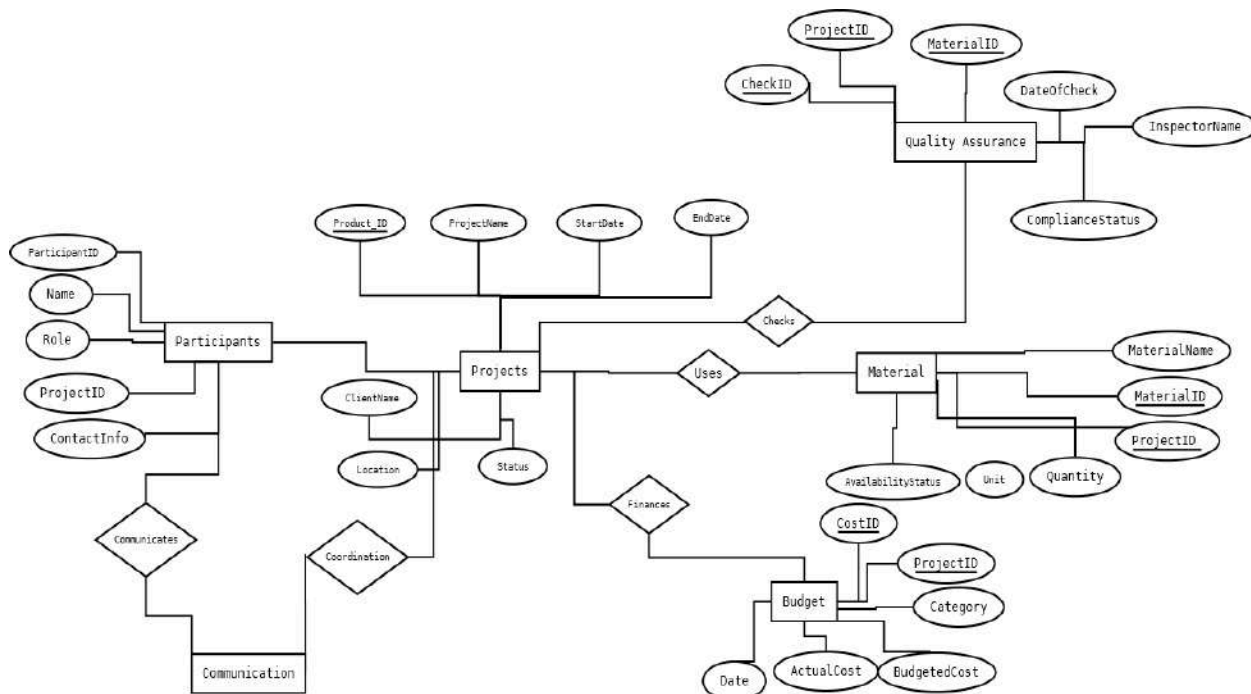

Entity (Finalized)	Attribute Set (Finalized)	Relationship Set (Finalized)
Standards Table	StandardID (PK), StandardDescription, Category, ApplicableTo	Provide guidelines for construction and safety protocols
Inspections Table	InspectionID (PK), ProjectID (FK), Date, InspectorName, Result (Pass, Fail), Comments	Perform regular inspections

## Schema and ERD Design

The schema is built using the ER Diagram, and relationships are constructed with foreign key constraints to depict various cardinalities, including one-to-one and one-to-many. Hence, all key associations between entities - for example, projects, materials, participants, and inspections - are accurately captured. The Initial Relations are :

1. **Projects**
2. **Materials**
3. **Monitoring Tools**
4. **Costs & Budgets**
5. **Quality Assurance**
6. **Participants**
7. **Communication**
8. **Standards**
9. **Inspections**

**ER Diagram - Version 1:**

## ER Diagram Improvement

### Identify Entity Types

- **Projects**
  - Attributes: ProjectID (PK), ProjectName, StartDate, EndDate, ClientName, Location, Status
- **Materials**
  - Attributes: MaterialID (PK), MaterialName, ProjectID (FK), Quantity, Unit, AvailabilityStatus
- **Monitoring Tools**
  - Attributes: ToolID (PK), ToolName, MeasurementType, ProjectID (FK), MeasurementValue, Unit
- **Costs & Budgets**
  - Attributes: CostID (PK), ProjectID (FK), BudgetedCost, ActualCost, Category, Date
- **Quality Assurance**
  - Attributes: CheckID (PK), ProjectID (FK), MaterialID (FK), DateOfCheck, ComplianceStatus, InspectorName
- **Participants**
  - Attributes: ParticipantID (PK), Name, Role, ProjectID (FK), ContactInfo
- **Communication**
  - Attributes: CommunicationID (PK), ProjectID (FK), ParticipantID (FK), Date, Message, Status
- **Standards**
  - Attributes: StandardID (PK), StandardDescription, Category, ApplicableTo
- **Inspections**
  - Attributes: InspectionID (PK), ProjectID (FK), Date, InspectorName, Result, Comments

## Identify Relationship Types

Below are the primary relationships among the entities, noting cardinality and participation requirements where relevant.

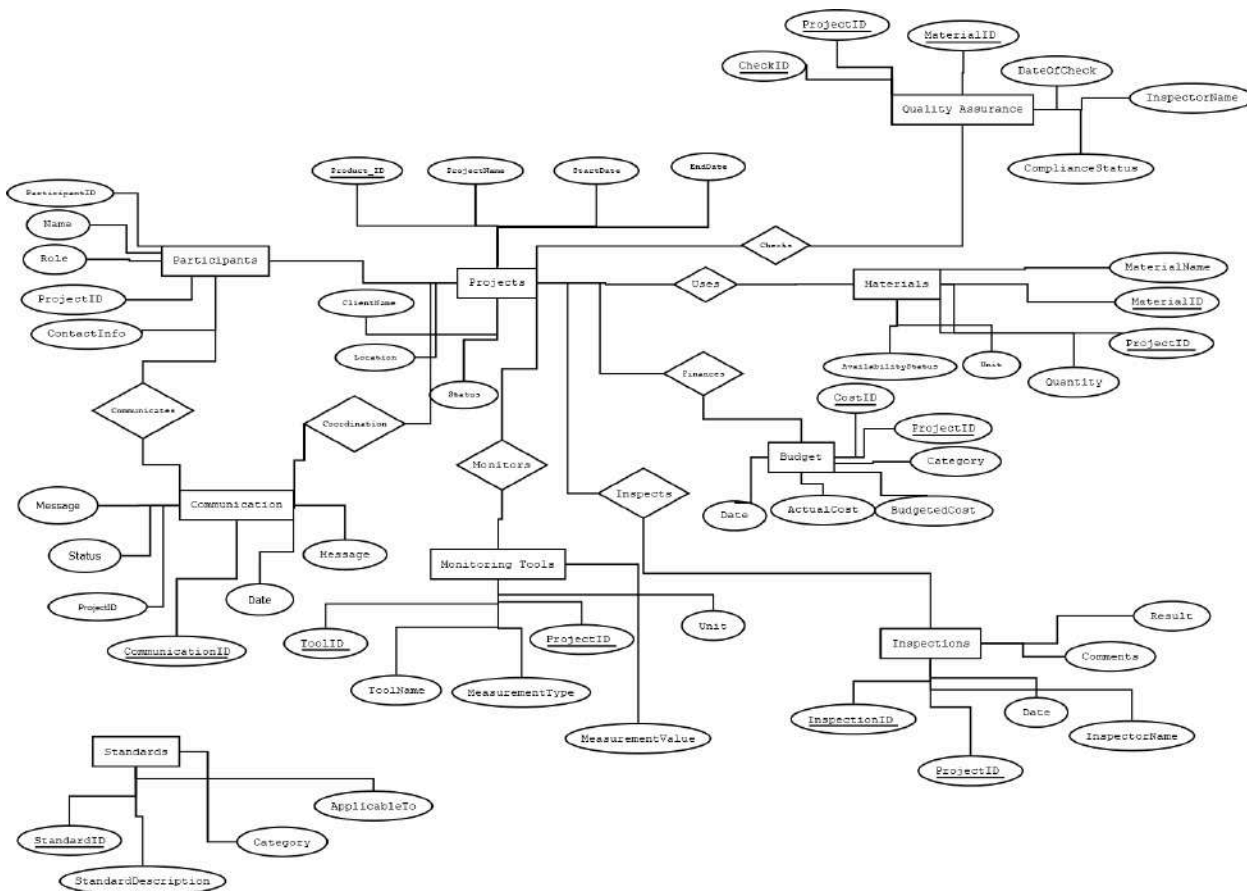

- **Project-Materials Relationship**
  - **Description:** Each project can use multiple materials, but each material is dedicated to one project.
  - **Cardinality:** One-to-Many (1) from Projects to Materials
  - **Participation:** Mandatory for both Projects and Materials since materials are essential resources for construction.
- **Project-Monitoring Tools Relationship**
  - **Description:** Multiple monitoring tools are employed in a project, with each tool specific to one project.
  - **Cardinality:** One-to-Many (1) from Projects to Monitoring Tools
  - **Participation:** Mandatory for both entities to track the tools necessary for monitoring measurements.
- **Project-Costs & Budgets Relationship**
  - **Description:** A project has various costs and budgets to manage different expense categories.
  - **Cardinality:** One-to-Many (1) from Projects to Costs & Budgets
  - **Participation:** Mandatory for both to monitor the financial aspects of each project accurately.
- **Project-Quality Assurance Relationship**
  - **Description:** Each project requires multiple quality checks, focusing on compliance with standards.
  - **Cardinality:** One-to-Many (1) from Projects to Quality Assurance
  - **Participation:** Mandatory for both to ensure that projects meet quality standards.
- **Project-Participants Relationship**
  - **Description:** A project involves many participants, each with a distinct role.
  - **Cardinality:** One-to-Many (1) from Projects to Participants
  - **Participation:** Mandatory for both as participants are vital for project operations.

- **Project-Communication Relationship**
  - **Description:** Communications occur within each project among participants.
  - **Cardinality:** One-to-Many (1) from Projects to Communication
  - **Participation:** Mandatory, as logging communications is essential for project coordination.
- **Project-Standards Relationship**
  - **Description:** Projects adhere to standards which outline the guidelines and requirements they must follow.
  - **Cardinality:** Many-to-Many (M), since multiple projects can adopt various standards, and each standard may apply to different projects.
  - **Participation:** Mandatory for both to ensure compliance across all projects.
- **Project-Inspections Relationship**
  - **Description:** Each project undergoes regular inspections to confirm adherence to safety, quality, and other criteria.
  - **Cardinality:** One-to-Many (1) from Projects to Inspections
  - **Participation:** Mandatory, as inspections are integral to maintaining standards.

## ER Diagram Analysis

Although the current schema may succeed in modeling core relationships, further fine-tuning can actually enhance clarity and reduce redundancy and thus optimize structure in favor of better querying efficiency and adherence to higher orders of normalization in a database.

### ER Diagram - Final Version :

## Mapping ER Model to Relational Model

### Entity to Relation Tables:

#### 1. Projects

Schema:

```
"Projects": [
    "ProjectID (Primary Key)",
    "ProjectName",
    "StartDate",
    "EndDate",
    "ClientName",
    "Location",
    "Status",
],
```

Attributes	Constraints	Data Type
Project Id	<u>Primary key</u>	INT
Project Name	Not Null	VARCHAR
Startdate	Not Null	DATE
End Date	Not Null	DATE
Client Name	Not Null	VARCHAR
Location	Not Null	VARCHAR
Status	Not Null	VARCHAR

## 2. Materials

Schema:

```
"Materials": [  
    "MaterialID (Primary Key)",  
    "MaterialName",  
    "ProjectID (Foreign Key to Projects)",  
    "Quantity",  
    "Unit",  
    "AvailabilityStatus",  
],
```

Attributes	Constraints	Data Type
MaterialID	<u>Primary Key</u>	INT
MaterialName	NOT NULL	VARCHAR
ProjectID	<u>Foreign Key</u> (Reference: Project)	INT
Quantity	NOT NULL	INT
Unit	NOT NULL	VARCHAR
AvailabilityStatus	NOT NULL	VARCHAR

### 3. Monitoring Tools

Schema:

```
"Monitoring Tools": [
    "ToolID (Primary Key)",
    "ToolName",
    "MeasurementType",
    "ProjectID (Foreign Key to Projects)",
    "MeasurementValue",
    "Unit",
],
```

Attributes	Constraints	Data Type
ToolID	<u>Primary Key</u>	INT
ToolName	NOT NULL	VARCHAR
ProjectID	<u>Foreign Key</u> (Reference: Project)	INT
MeasurementType	NOT NULL	VARCHAR
MeasurementValue	NOT NULL	FLOAT
Unit	NOT NULL	VARCHAR

## 4. Costs and Budget

Schema

```
"Costs & Budgets": [
    "CostID (Primary Key)",
    "ProjectID (Foreign Key to Projects)",
    "BudgetedCost",
    "ActualCost",
    "Category",
    "Date",
],
```

Attributes	Constraints	Data Type
CostID	<u>Primary Key</u>	INT
BudgetedCost	NOT NULL	FLOAT
ProjectID	<u>Foreign Key</u> (Reference: Project)	INT
ActualCost	NOT NULL	FLOAT
Category	NOT NULL	VARCHAR
Date	NOT NULL	DATE

## 5. Quality Assurance

Schema:

```
"Quality Assurance": [
    "CheckID (Primary Key)",
    "ProjectID (Foreign Key to Projects)",
    "MaterialID (Foreign Key to Materials)",
    "DateOfCheck",
    "ComplianceStatus",
    "InspectorName",
],
```

Attributes	Constraints	Data Type
CheckID	<u>Primary Key</u>	INT
MaterialID	<u>Foreign Key</u> (Reference: Materials)	INT
ProjectID	<u>Foreign Key</u> (Reference: Project)	INT
InspectorName	<u>Foreign Key</u> (Reference: Inspections)	VARCHAR
ComplianceStatus	NOT NULL	VARCHAR
DateOfCheck	NOT NULL	DATE

## 6. Participants

Schema:

```
"Participants": [
  "ParticipantID (Primary Key)",
  "Name",
  "Role",
  "ProjectID (Foreign Key to Projects)",
  "ContactInfo",
  "DateOfCheck"
],
```

Attributes	Constraints	Data Type
ParticipantID	<u>Primary Key</u>	INT
Name	NOT NULL	VARCHAR
ProjectID	<u>Foreign Key</u> (Reference: Project)	INT
Role	NOT NULL	VARCHAR
ContactInfo	NOT NULL	VARCHAR
DateOfCheck	NOT NULL	DATE

## 7. Communication & coordination

Schema:

```
"Communication & Coordination": [
    "CommunicationID (Primary Key)",
    "ProjectID (Foreign Key to Projects)",
    "Date",
    "ParticipantID (Foreign Key to Participants)",
    "Message",
    "Status",
],
```

Attributes	Constraints	Data Type
CommunicationID	<u>Primary Key</u>	INT
ParticipantID	<u>Foreign Key</u> (Reference: Participants)	INT
ProjectID	<u>Foreign Key</u> (Reference: Project)	INT
Message	NOT NULL	VARCHAR
Status	NOT NULL	VARCHAR
Date	NOT NULL	DATE

## 8. Standards

Schema:

```
"Standards": [  
    "StandardID (Primary Key)",  
    "StandardDescription",  
    "Category",  
    "ApplicableTo",  
],
```

Attributes	Constraints	Data Type
StandardID	<u>Primary Key</u>	INT
StandardDescription	NOT NULL	TEXT
Category	NOT NULL	VARCHAR
ApplicableTo	NOT NULL	VARCHAR

## 9. Inspections

Schema:

```
"Inspections": [
    "InspectionID (Primary Key)",
    "ProjectID (Foreign Key to Projects)",
    "Date",
    "InspectorName",
    "Result",
    "Comments",
],
}
```

Attributes	Constraints	Data Type
InspectionID	<u>Primary Key</u>	INT
Result	NOT NULL	VARCHAR
ProjectID	<u>Foreign Key</u> (Reference: Project)	INT
InspectorName	NOT NULL	VARCHAR
Comments	NOT NULL	TEXT
Date	NOT NULL	DATE

## Entities and their attributes (with primary key and foreign key, if any)

**Projects** (ProjectID, ProjectName, StartDate, EndDate, ClientName, Location, Status)

**Materials** (MaterialID, MaterialName, ProjectID (FK), Quantity, Unit, AvailabilityStatus)

**Monitoring Tools** (ToolID, ToolName, MeasurementType, ProjectID (FK), MeasurementValue, Unit)

**Costs & Budgets** (CostID, ProjectID (FK), BudgetedCost, ActualCost, Category, Date)

**Quality Assurance** (CheckID, ProjectID (FK), MaterialID (FK), DateOfCheck, ComplianceStatus, InspectorName)

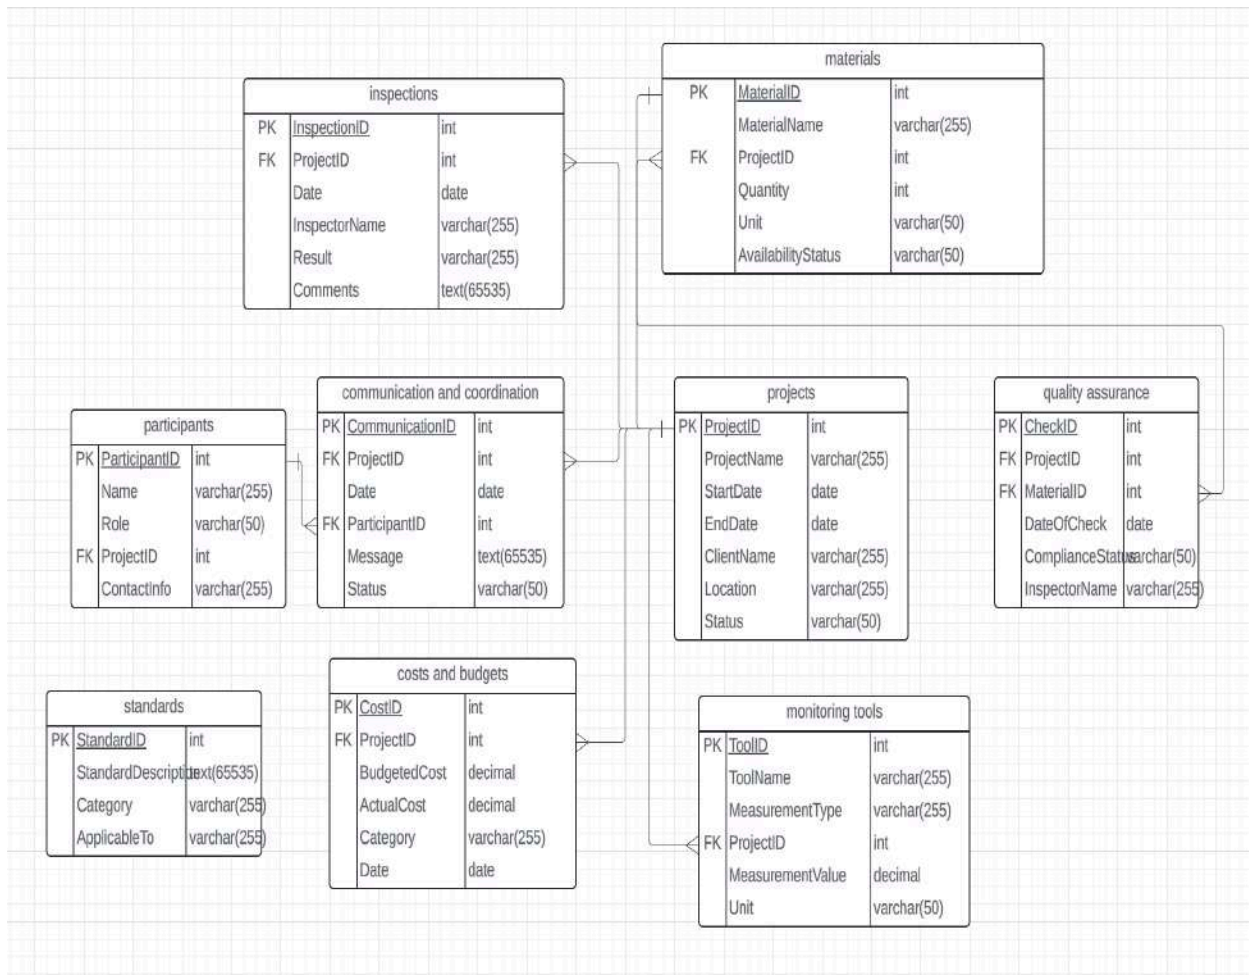

**Participants** (ParticipantID, Name, Role, ProjectID (FK), ContactInfo)

**Communication** (CommunicationID, ProjectID (FK), ParticipantID (FK), Date, Message, Status)

**Standards** (StandardID, StandardDescription, Category, ApplicableTo)

**Inspections** (InspectionID, ProjectID (FK), Date, InspectorName, Result, Comments)

```

```
CREATE TABLE Inspections (  
    InspectionID SERIAL PRIMARY KEY,  
    ProjectID INT REFERENCES Projects(ProjectID),  
    Date DATE,  
    InspectorName VARCHAR(255),  
    Result VARCHAR(255),  
    Comments TEXT  
);
```

## **Chapter 3:** Normalization of Database

## Normalization and Schema Refinement

### Original Design of Database :

- **Projects**
  - Attributes: ProjectID (PK), ProjectName, StartDate, EndDate, ClientName, Location, Status
- **Materials**
  - Attributes: MaterialID (PK), MaterialName, ProjectID (FK), Quantity, Unit, AvailabilityStatus
- **Monitoring Tools**
  - Attributes: ToolID (PK), ToolName, MeasurementType, ProjectID (FK), MeasurementValue, Unit
- **Costs & Budgets**
  - Attributes: CostID (PK), ProjectID (FK), BudgetedCost, ActualCost, Category, Date
- **Quality Assurance**
  - Attributes: CheckID (PK), ProjectID (FK), MaterialID (FK), DateOfCheck, ComplianceStatus, InspectorName
- **Participants**
  - Attributes: ParticipantID (PK), Name, Role, ProjectID (FK), ContactInfo
- **Communication**
  - Attributes: CommunicationID (PK), ProjectID (FK), ParticipantID (FK), Date, Message, Status
- **Standards**
  - Attributes: StandardID (PK), StandardDescription, Category, ApplicableTo
- **Inspections**
  - Attributes: InspectionID (PK), ProjectID (FK), Date, InspectorName, Result, Comments

## Dependency Analysis

All types of dependencies (PK, FK, Functional Dependencies) for each relation :

### 1. Projects Table

Projects (ProjectID, ProjectName, StartDate, EndDate, ClientName, Location, Status)

- **Primary Key:** ProjectID
- **Foreign Key:** None
- **Functional dependencies:**

ProjectID-> ProjectName, StartDate, EndDate, ClientName, Location, Status

### 2. Materials Table

Materials (MaterialID, MaterialName, ProjectID (FK), Quantity, Unit, AvailabilityStatus)

- **Primary Key:** MaterialID
- **Foreign Key:** ProjectID
- **Functional dependencies:**

MaterialID -> MaterialName, ProjectID , Quantity, Unit, AvailabilityStatus

### 3. Monitoring Tools Table

MonitoringTools (ToolID, ToolName, MeasurementType, ProjectID (FK), MeasurementValue, Unit)

- **Primary Key:** ToolID
- **Foreign Key:** ProjectID
- **Functional dependencies:**

ToolID-> ToolName, MeasurementType, *ProjectID*, MeasurementValue, Unit

#### 4. Costs & Budgets Table

Costs & Budgets (CostID, ProjectID (FK), BudgetedCost, ActualCost, Category, Date)

- **Primary Key:** CostID
- **Foreign Key:** ProjectID
- **Functional dependencies:**

CostID-> ProjectID, BudgetedCost, ActualCost, Category, Date

#### 5. Quality Assurance Table

Quality Assurance (CheckID, ProjectID (FK), MaterialID (FK), DateOfCheck, ComplianceStatus, InspectorName)

- **Primary Key:** CheckID
- **Foreign Key:** ProjectID, MaterialID
- **Functional dependencies:**

CheckID-> ProjectID (FK), MaterialID (FK), DateOfCheck, ComplianceStatus, InspectorName

#### 6. Participants Table

Participants (ParticipantID, Name, Role, ProjectID (FK), ContactInfo)

- **Primary Key:** ParticipantID
- **Foreign Key:** ProjectID
- **Functional dependencies:**

ParticipantID-> ParticipantID, Name, Role, ProjectID (FK), ContactInfo

#### 7. Communication Table

Communication (CommunicationID, ProjectID (FK), ParticipantID (FK), Date, Message, Status)

- **Primary Key:** CommunicationID
- **Foreign Key:** ProjectID
- **Functional dependencies:**

CommunicationID-> ProjectID, ParticipantID, Date, Message, Status

## 8. Standards Table

Standards (StandardID, StandardDescription, Category, ApplicableTo)

- **Primary Key:** StandardID
- **Foreign Key:** None
- **Functional dependencies:**

StandardID -> StandardID, StandardDescription, Category, ApplicableTo

## 9. Inspections Table

Inspections (InspectionID, ProjectID (FK), Date, InspectorName, Result, Comments)

- **Primary Key:** InspectionID
- **Foreign Key:** ProjectID,
- **Functional dependencies:**

InspectionID -> ProjectID (FK), Date, InspectorName, Result, Comments

# Redundancies and Anomalies Documentation

## Redundancies

### 1. Projects Table:

**Attributes:** ProjectID, ProjectName, StartDate, EndDate, ClientName, Location, Status

**Redundancy:**

- Storing ClientName directly can lead to duplication if multiple projects share the same client.
- Storing Location directly may cause redundancy if multiple projects are located in the same area.

**Solution:**

- Create a separate Clients table to store ClientID and ClientName.
- Create a separate Locations table to store LocationID and Location, and replace Location in Projects with LocationID (FK).

### 2. Materials Table:

**Attributes:** MaterialID, MaterialName, ProjectID (FK), Quantity, Unit, AvailabilityStatus

**Redundancy:**

- The ProjectID here indicates a relationship that can lead to redundancy if the same material is used across multiple projects.

**Solution:**

- Consider keeping MaterialID and MaterialName in a separate Materials table, linking it to a many-to-many relationship with projects via a junction table (e.g., Material\_Project), which can hold Quantity, Unit, and AvailabilityStatus.

### 3. Monitoring Tools Table:

**Attributes:** ToolID, ToolName, MeasurementType, ProjectID (FK), MeasurementValue, Unit

**Redundancy:**

- Including ProjectID here may lead to redundancy if the same tool is used in multiple projects.

**Solution:**

- Like materials, consider a many-to-many relationship by creating a junction table (e.g., Tool\_Project), which can hold MeasurementValue and Unit.

### 4. Costs & Budgets Table:

**Attributes:** CostID, ProjectID (FK), BudgetedCost, ActualCost, Category, Date

**Redundancy:**

- Storing Category directly can lead to inconsistency if not standardized across the database.

**Solution:**

- Create a separate Categories table with CategoryID and CategoryName, and replace Category in this table with CategoryID (FK).

## 5. Quality Assurance Table:

**Attributes:** CheckID, ProjectID (FK), MaterialID (FK), DateOfCheck, ComplianceStatus, InspectorName

**Redundancy:**

- Including ProjectID here may lead to redundancy if the same tool is used in multiple projects.

**Solution:**

- Storing InspectorName directly can cause duplication if the same inspector is involved in multiple checks.

## 6. Participants Table:

**Attributes:** ParticipantID, Name, Role, ProjectID (FK), ContactInfo

**Redundancy:**

- Storing Role directly can lead to inconsistencies if not defined in a standardized way.

**Solution:**

- Create a Roles table with RoleID and RoleName, and replace Role in this table with RoleID (FK).

## 7. Communication Table:

**Attributes:** CommunicationID, ProjectID (FK), ParticipantID (FK), Date, Message, Status

**Redundancy:**

- The Status attribute may vary for messages and could lead to inconsistency if not standardized.

**Solution:**

- Create a Status table for communication statuses and replace Status with StatusID (FK).

## 8. Inspections Table:

**Attributes:** InspectionID, ProjectID (FK), Date, InspectorName, Result, Comments

**Redundancy:**

- Similar to Quality Assurance, storing InspectorName directly can lead to duplication.

**Solution:**

- Use InspectorID from the Inspectors table instead of InspectorName.

## **Anomalies**

### 1. Material Table Anomalies:

- Insert Anomalies:

New Material can't be added unless a Project is assigned to it.

It's possible to have extra material or reusable material from another project which isn't assigned to any project.

### 2. Cost & Budget Table Anomalies :

- Insert Anomalies:

A New Budget or Cost can't be inserted unless a Project has been assigned to it.

### 3. Quality Assurance Table Anomalies :

- Insert Anomalies:

A Quality Assurance check of a material cannot be inserted unless the availability status of the material is 'in-stock'.

### 4. Participants Table Anomalies:

- Deletion Anomalies:

Deletion of a Participant may result in data loss to tables such as 'Project' or 'Inspection' as the Participant might be an entity in the above-mentioned tables and has a ForeignKey Constraint to the same.

### 5. Inspections Table Anomalies:

- Insert Anomalies:

The attribute 'Inspector Name' should be a reference key to the Participants table, in order to increase the ease of access of the information and for the updation of the same.

### 6. Standards Table Anomalies:

- Updation Anomalies:

The Standards table has been deemed redundant as the functionality is achieved through 'Inspections' Table. Hence, Duplicate Records will be formed. Updations in the Inspection Table won't be reflected in the Standards table. Hence , Multiple updates will be needed to maintain the Standards table.

Action : Removal of Standards table from the Schema.

#### 7. Reference to client details/information anomaly

When referencing the client table from projects table, there is only client name as an attribute and no further details, what we can do instead is add clientID referencing to participants tables.

## Normalization Process

### First Normal Form (1NF):

All tables in the revised schema already adhere to 1NF. Each attribute contains atomic values, and primary keys are defined.

### Second Normal Form (2NF):

To check if a schema is in second normal form or not we check for partial dependencies. In this schema, none of the tables contain composite primary keys, which means we can proceed without changes.

- **Material\_Project** has a composite primary key (MaterialID, ProjectID), and each non-key attribute (Quantity, Unit, AvailabilityStatus) depends on both keys.
- **Tool\_Project** has a composite primary key (ToolID, ProjectID), and each non-key attribute (MeasurementValue, Unit) depends on both keys.
- Other tables have single primary keys, and all non-key attributes depend solely on those keys.

### Third Normal Form (3NF):

Here we eliminate all the transitive dependencies.

1. **Projects:**

- i. No transitive dependencies are present.

2. **Costs & Budgets:**

- i. Ensure CategoryID refers to Categories and is not dependent on any other non-key attribute.

3. **Participants:**

- i. RoleID refers to Roles, ensuring it does not depend on other non-key attributes.

4. **Quality Assurance:**

- i. InspectorID refers to Inspectors, ensuring it does not depend on other non-key attributes.

5. **Communication:**

- i. StatusID refers to Status, ensuring it does not depend on other non-key attributes.

6. **Standards:**

- i. Ensure CategoryID is linked to Categories and does not depend on non-key attributes.

## Summary of the Normalized Schema

After checking for 1NF, 2NF, and 3NF, we confirm that the schema is normalized. The schema is now normalized up to the third normal form (3NF). And because all functional dependencies have their determinant as a superkey, it is also in Boyce-Codd Normal Form (BCNF). Hence, the final schema:

**1. Projects:**

- **Attributes:** ProjectID (PK), ProjectName, StartDate, EndDate, ClientID (FK), LocationID (FK), Status

**2. Clients:**

- **Attributes:** ClientID (PK), ClientName, ContactInfo

**3. Locations:**

- **Attributes:** LocationID (PK), LocationName

**4. Materials:**

- **Attributes:** MaterialID (PK), MaterialName

**5. Material\_Project:**

- **Attributes:** MaterialID (FK), ProjectID (FK), Quantity, Unit, AvailabilityStatus

**6. Monitoring Tools:**

- **Attributes:** ToolID (PK), ToolName, MeasurementType

**7. Tool\_Project:**

- **Attributes:** ToolID (FK), ProjectID (FK), MeasurementValue, Unit

**8. Costs & Budgets:**

- **Attributes:** CostID (PK), ProjectID (FK), BudgetedCost, ActualCost, CategoryID (FK), Date

**9. Categories:**

- **Attributes:** CategoryID (PK), CategoryName

**10. Quality Assurance:**

- **Attributes:** CheckID (PK), ProjectID (FK), MaterialID (FK), DateOfCheck, ComplianceStatus, InspectorID (FK)

**11. Inspectors:**

- **Attributes:** InspectorID (PK), InspectorName

12. **Participants:**
  - **Attributes:** ParticipantID (PK), Name, RoleID (FK), ProjectID (FK), ContactInfo
13. **Roles:**
  - **Attributes:** RoleID (PK), RoleName
14. **Communication:**
  - **Attributes:** CommunicationID (PK), ProjectID (FK), ParticipantID (FK), Date, Message, StatusID (FK)
15. **Status:**
  - **Attributes:** StatusID (PK), StatusDescription
16. **Standards:**
  - **Attributes:** StandardID (PK), StandardDescription, CategoryID (FK), ApplicableTo
17. **Inspections:**
  - **Attributes:** InspectionID (PK), ProjectID (FK), Date, InspectorID (FK), Result, Comments

## **Chapter 4:** Implementation of Database

## Revised DDL Scripts

– Inspectors Table

```
CREATE TABLE "conDB".Inspectors (  
    InspectorID SERIAL PRIMARY KEY,  
    InspectorName VARCHAR(255)  
);
```

-- Roles Table

```
CREATE TABLE "conDB".Roles (  
    RoleID SERIAL PRIMARY KEY,  
    RoleName VARCHAR(255)  
);
```

-- Clients Table

```
CREATE TABLE "conDB".Clients (  
    ClientID SERIAL PRIMARY KEY,  
    ClientName VARCHAR(255),  
    ContactInfo VARCHAR(255)  
);
```

-- Locations Table

```
CREATE TABLE "conDB".Locations (  
    LocationID SERIAL PRIMARY KEY,  
    LocationName VARCHAR(255)  
);
```

-- Materials Table

```
CREATE TABLE "conDB".Materials (  
    MaterialID SERIAL PRIMARY KEY,  
    MaterialName VARCHAR(255)  
);
```

-- Status Table

```
CREATE TABLE "conDB".Status (  
    StatusID SERIAL PRIMARY KEY,  
    StatusDescription VARCHAR(50)  
);
```

-- Categories Table

```
CREATE TABLE "conDB".Categories (  
    CategoryID SERIAL PRIMARY KEY,  
    CategoryName VARCHAR(255)  
);
```

-- Projects Table

```
CREATE TABLE "conDB".Projects (  
    ProjectID SERIAL PRIMARY KEY,  
    ProjectName VARCHAR(255),  
    StartDate DATE,  
    EndDate DATE,  
    ClientID INT REFERENCES "conDB".Clients(ClientID),  
    LocationID INT REFERENCES "conDB".Locations(LocationID),  
    Status TEXT

# SQL Queries

## 1. Project with Maximum Participants

The screenshot shows a SQL IDE interface with a query editor and a data output window. The query editor contains the following SQL code:

```
1 SELECT t.ProjectName, p.max_participants
2 FROM Projects AS t
3 JOIN (
4     SELECT ProjectID, COUNT(*) AS max_participants
5     FROM Participants
6     GROUP BY ProjectID
7     ORDER BY max_participants
8     DESC
9     LIMIT 1
10 ) AS p ON p.ProjectID = t.ProjectID;
```

The data output window shows the results of the query:

	projectname character varying (255)	max_participants bigint
1	Metro Line Extension	69

## 2. Projects with Least Participants

Query Query History

```

1 SELECT t.ProjectName, p.max_participants
2 FROM Projects AS t
3 JOIN (
4     SELECT ProjectID, COUNT(*) AS max_participants
5     FROM Participants
6     GROUP BY ProjectID
7     ORDER BY max_participants
8     ASC
9     LIMIT 1
10 ) AS p ON p.ProjectID = t.ProjectID;
11

```

Data Output Messages Notifications

	projectname character varying (255)	max_participants bigint
1	Highway Expansion Project	28

## 3. List all the Ongoing Projects

Object Explorer SQL Statistics Dependencies Dependents Processes conDB/postgres@... conDB/postgres@PostgreSQL 16\* conDB.projects/co... x

conDB/postgres@PostgreSQL 16

No limit

Query Query History

```

1 SELECT projectname as Ongoing_Projects
2 FROM projects
3 WHERE status = 'In Progress'

```

Data Output Messages Notifications

	ongoing_projects character varying (255)
1	Highway Expansion Project
2	Shopping Mall Development
3	Healthcare Facility
4	Solar Power Plant
5	Green Housing Project
6	Railway Station Upgrade
7	Suburban Housing Development

Total rows: 7 of 7 Query complete 00:00:00.208 Ln 3, Col 17

#### 4. Retrieve All Projects with Their Clients' Names

The screenshot shows a PostgreSQL IDE interface. On the left, the 'Object Explorer' pane displays a database schema with tables like 'categories', 'clients', 'communic', 'costs', 'inspections', 'inspectors', 'locations', 'material\_pi', 'materials', 'monitoring', 'participant', 'projects', 'qualityass', 'roles', 'standards', 'status', 'tool\_project', 'Trigger Funct', 'Types', 'Views', 'public', 'Subscriptions', 'postgres', 'Login/Group Roles', and 'Tables/aces (2)'. The 'projects' table is selected. The main query editor shows the following SQL query:

```
1 SELECT p.ProjectName, c.ClientName
2 FROM Projects p
3 JOIN Clients c ON p.ClientID = c.ClientID;
4
```

The 'Data Output' pane at the bottom displays the results of the query, showing 16 rows of project data with columns 'projectname' and 'clientname'.

projectname	clientname
Residential Complex Phase I	KCC Buildcon
Highway Expansion Project	Mohantal Sukhadia University
Corporate Office Park	Manohar B. Dhanuka
Metro Line Extension	Bharat Infrastructure
Shopping Mall Development	Punj Lloyd
School Campus Construction	Tata Housing Development Company
Luxury Apartment Tower	HCC Ltd.
Healthcare Facility	Rajiv Gandhi International Airport
Industrial Park Development	Sterling and Wilson
Airport Terminal Expansion	Vishnu Builders
Solar Power Plant	Gujarat Pipevay Port
Hydroelectric Dam Construction	M/s. Simplex Infrastructures
IT Park Development	Ruchira Construction
Green Housing Project	Kochi Water Metro
Urban Revitalization	Shapoorji Pallonji Group
Railway Station Upgrade	C.E. Construction

Total rows: 20 of 20 Query complete 00:00:00.120 Ln 4, Col 1

#### 5. Material which are currently in-stock

The screenshot shows a PostgreSQL IDE interface. The main query editor shows the following SQL query:

```
1
2 SELECT * from material_project where availabilitystatus='In Stock';
```

The 'Data Output' pane at the bottom displays the results of the query, showing 6 rows of material data with columns 'materialprojectid', 'materialid', 'projectid', 'quantity', 'unit', and 'availabilitystatus'.

materialprojectid [PK] integer	materialid integer	projectid integer	quantity integer	unit character varying (50)	availabilitystatus character varying (50)
1	1	3	500	kg	In Stock
2	9	8	750	kg	In Stock
3	16	11	1000	kg	In Stock
4	20	19	1150	liters	In Stock
5	26	8	660	liters	In Stock
6	30	13	700	liters	In Stock

Total rows: 10 of 10 Query complete 00:00:00.070

## 6. Show Materials That Have Low Availability in Projects

The screenshot shows a PostgreSQL IDE interface. On the left is the Object Explorer with a tree view of database objects. The 'material\_project' table is selected, and its 'Columns (6)' are expanded. The main query editor displays the following SQL query:

```
1 SELECT m.MaterialName, mp.ProjectID, mp.AvailabilityStatus
2 FROM Materials m
3 JOIN Material_Project mp ON m.MaterialID = mp.MaterialID
4 WHERE mp.AvailabilityStatus = 'Low Stock';
```

Below the query editor, the 'Data Output' tab shows the results of the query. The results are displayed in a table with three columns: materialname, projectid, and availabilitystatus. The data is as follows:

materialname	projectid	availabilitystatus
Brick	1	Low Stock
Gypsum	10	Low Stock
Mortar	13	Low Stock
Paint	5	Low Stock
Plywood	15	Low Stock
Fiber Cement Board	8	Low Stock
Glass	18	Low Stock

The status bar at the bottom indicates 'Total rows: 7 of 7', 'Query complete 00:00:00.113', and 'Ln 4, Col 41'.

## 7. Get All Communication Messages Marked as "Unread" or "Follow-up Required"

The screenshot shows the PostgreSQL IDE interface. The Object Explorer on the left lists various database objects, including tables. The main query window displays the following SQL query:

```
-- Get All Communication Messages Marked as "Unread" or "Follow-up Required"
SELECT c.CommunicationID, c.Message, s.StatusDescription, p.ProjectName
FROM Communication c
JOIN Status s ON c.StatusID = s.StatusID
JOIN Projects p ON c.ProjectID = p.ProjectID
WHERE s.StatusDescription IN ('Unread', 'Follow-up Required');
```

The Data Output pane shows the results of the query, displaying 11 rows of communication messages. The columns are: communicationid, message, statusdescription, and projectname.

communicationid	message	statusdescription	projectname
1	Initial project briefing.	Unread	Shopping Mall Development
2	Follow-up on safety protocols.	Follow-up Required	Public Park Renovation
3	Material specification clarification.	Follow-up Required	Green Housing Project
4	Safety equipment check.	Unread	Solar Power Plant
5	Permit requirement update.	Follow-up Required	Residential Tower Complex
6	Finalized budget allocation.	Unread	Hydroelectric Dam Construction
7	Inspection checklist update.	Follow-up Required	Healthcare Facility
8	Site access issue resolution.	Unread	Highway Expansion Project
9	Follow-up on vendor payment.	Follow-up Required	Solar Power Plant
10	Cost overrun analysis.	Follow-up Required	Green Housing Project
11	Inspection review completed.	Unread	School Campus Construction

Total rows: 11 of 11 Query complete 00:00:00.121 Ln 8, Col 1

## 8. Find the Latest Inspection Date for Each Project

The screenshot shows the PostgreSQL IDE interface. The Object Explorer on the left lists various database objects, including tables. The main query window displays the following SQL query:

```
-- Find the Latest Inspection Date for Each Project
SELECT p.ProjectName, MAX(i.Date) AS LatestInspectionDate
FROM Projects p
JOIN Inspections i ON p.ProjectID = i.ProjectID
GROUP BY p.ProjectName;
```

The Data Output pane shows the results of the query, displaying 16 rows of project names and their latest inspection dates. The columns are: projectname and latestinspectiondate.

projectname	latestinspectiondate
Corporate Office Park	2024-11-03
Healthcare Facility	2024-11-08
Residential Complex Phase I	2024-11-10
Green Housing Project	2024-11-21
Public Park Renovation	2024-11-28
Industrial Park Development	2024-11-09
Railway Station Upgrade	2024-11-16
Solar Power Plant	2024-11-11
Shopping Mall Development	2024-11-15
Residential Tower Complex	2024-11-17
Luxury Apartment Tower	2024-11-18
Airport Terminal Expansion	2024-11-29
Metro Line Extension	2024-11-04
University Campus Expansion	2024-11-29
Hydroelectric Dam Construction	2024-11-12
IT Park Development	2024-11-13

Total rows: 20 of 20 Query complete 00:00:00.209 Ln 3, Col 1

## 9. Find the Total Budgeted and Actual Costs for Each Project

The screenshot shows the PostgreSQL IDE interface. The Object Explorer on the left lists various database objects, with 'Columns (6)' selected under the 'material\_project' table. The main query editor displays the following SQL query:

```

1 SELECT p.ProjectName,
2        SUM(cb.BudgetedCost) AS TotalBudgetedCost,
3        SUM(cb.ActualCost) AS TotalActualCost
4 FROM Projects p
5 JOIN CostsAndBudgets cb ON p.ProjectID = cb.ProjectID
6 GROUP BY p.ProjectName;
7

```

The Data Output pane shows the results of the query, displaying 10 rows of project data with their respective total budgeted and actual costs.

projectname	totalbudgetedcost	totalactualcost
1	3225000.00	3175000.00
2	3050000.00	2989000.00
3	3485000.00	3435000.00
4	3315000.00	3265000.00
5	2950000.00	2855000.00
6	2975000.00	2910000.00
7	3400000.00	3350000.00
8	3145000.00	3088000.00
9	3130000.00	3075000.00
10	3040000.00	2985000.00

Total rows: 10 of 10 Query complete 00:00:00.236 Ln 7, Col 1

## 10. Get a List of All Materials Used in a Specific Project (e.g., ProjectID = 5)

The screenshot shows the PostgreSQL IDE interface. The Object Explorer on the left lists various database objects, with 'Columns (6)' selected under the 'material\_project' table. The main query editor displays the following SQL query:

```

1 SELECT m.MaterialName, mp.Quantity, mp.Unit
2 FROM Materials m
3 JOIN Material_Project mp ON m.MaterialID = mp.MaterialID
4 WHERE mp.ProjectID = 5;

```

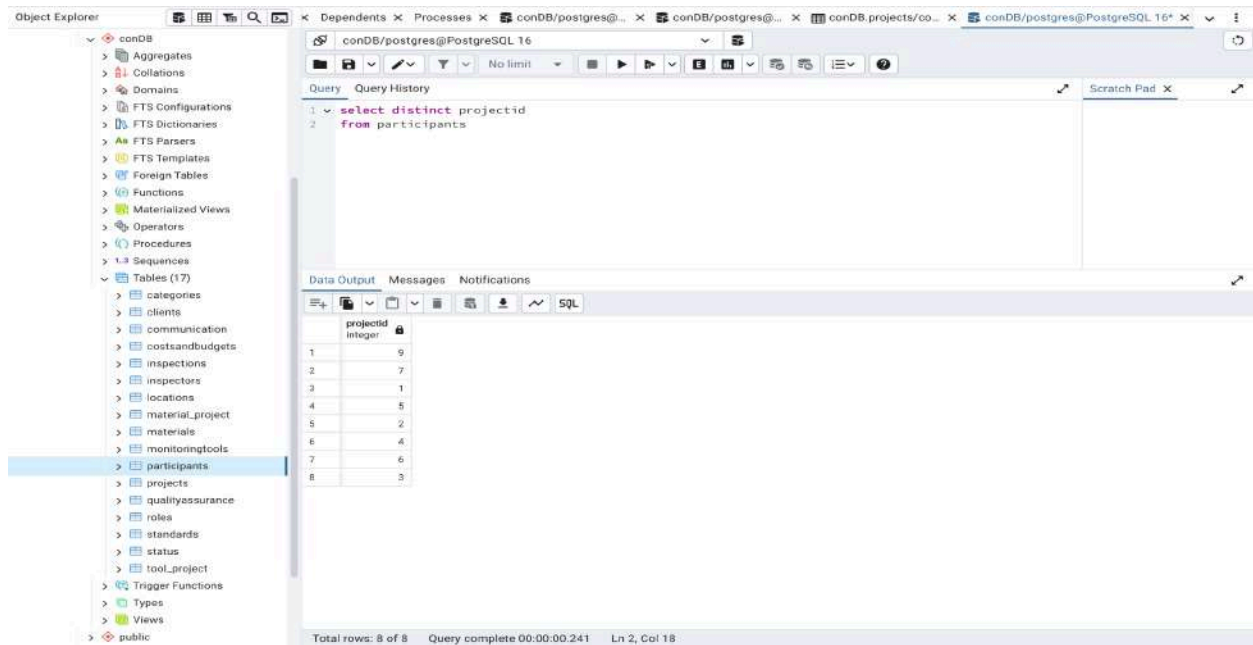

The Data Output pane shows the results of the query, displaying 3 rows of material data for ProjectID 5.

materialname	quantity	unit
1	250	liters
2	870	kg
3	620	pieces

Total rows: 3 of 3 Query complete 00:00:00.119 Ln 4, Col 24

11. Find out which projects have participants assigned without including each individual participant

The screenshot shows the PostgreSQL IDE interface. The Object Explorer on the left lists the database schema, with the 'participants' table highlighted under the 'Tables (17)' section. The main query editor displays the following SQL query:

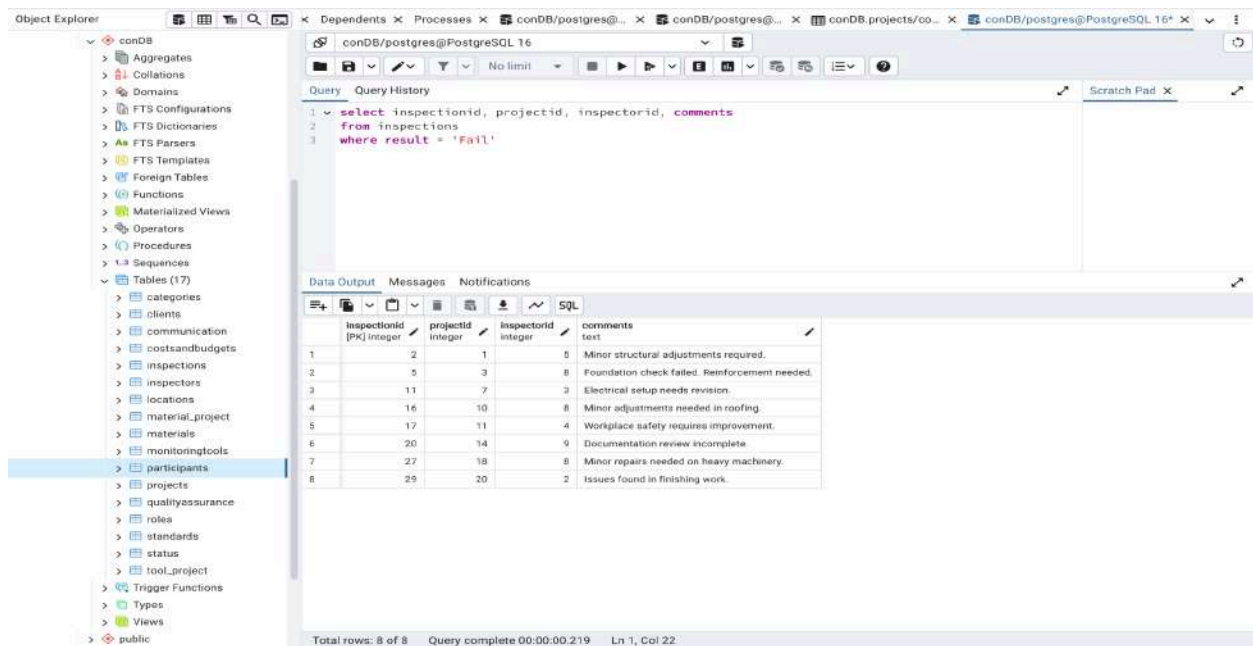

```
1 select distinct projectid
2 from participants
```

The Data Output pane shows the results of the query:

projectid	integer
1	9
2	7
3	1
4	5
5	2
6	4
7	6
8	3

Total rows: 8 of 8 Query complete 00:00:00.241 Ln 2, Col 18

12. Find the details of the inspections where the result of the inspection is Fail

The screenshot shows the PostgreSQL IDE interface. The Object Explorer on the left lists the database schema, with the 'inspections' table highlighted under the 'Tables (17)' section. The main query editor displays the following SQL query:

```
1 select inspectionid, projectid, inspectorid, comments
2 from inspections
3 where result = 'Fail'
```

The Data Output pane shows the results of the query:

inspectionid [PK] integer	projectid integer	inspectorid integer	comments text
1	2	1	Minor structural adjustments required.
2	5	3	Foundation check failed. Reinforcement needed.
3	11	7	Electrical setup needs revision.
4	16	10	Minor adjustments needed in roofing.
5	17	11	Workplace safety requires improvement.
6	20	14	Documentation review incomplete.
7	27	18	Minor repairs needed on heavy machinery.
8	29	20	Issues found in finishing work.

Total rows: 8 of 8 Query complete 00:00:00.219 Ln 1, Col 22

13. Get the name of the Inspector for further inspection where the result of the inspection is Fail

The screenshot shows the SQL Studio interface. The Object Explorer on the left lists the database schema, with 'participants' highlighted. The main query editor contains the following SQL query:

```

1 select i.inspectionid, i.projectid, i.inspectorid, i.comments, n.inspectorname
2 from inspections i
3 join inspectors n on i.inspectorid = n.inspectorid
4 where result = 'Fail'

```

The Data Output pane displays the results of the query:

	inspectionid integer	projectid integer	inspectorid integer	comments text	Inspectorname character varying (255)
1	29	20	2	Issues found in finishing work.	Jane Smith
2	11	7	3	Electrical setup needs revision.	Emily Davis
3	17	11	4	Workplace safety requires improvement.	Johnson Derby
4	2	1	5	Minor structural adjustments required.	Jonathan Smith
5	27	18	8	Minor repairs needed on heavy machinery.	Dinesh Solanki
6	16	10	8	Minor adjustments needed in roofing.	Dinesh Solanki
7	5	3	8	Foundation check failed. Reinforcement needed.	Dinesh Solanki
8	20	14	9	Documentation review incomplete.	Manish Maihota

Total rows: 8 of 8 Query complete 00:00:00.122 Ln 1, Col 67

14. List the quality assurances where the compliance status is Non-Compliant

The screenshot shows the SQL Studio interface. The Object Explorer on the left lists the database schema, with 'participants' highlighted. The main query editor contains the following SQL query:

```

1 select * from qualityassurance
2 where compliancestatus = 'Non-Compliant'

```

The Data Output pane displays the results of the query:

	checkid [PK] integer	projectid integer	materialid integer	dateofcheck date	compliancestatus character varying (50)	inspectorid integer
1	2	1	5	2024-01-20	Non-Compliant	2
2	5	3	1	2024-02-19	Non-Compliant	4
3	7	4	10	2024-03-10	Non-Compliant	6
4	10	6	12	2024-04-01	Non-Compliant	8
5	13	8	11	2024-04-20	Non-Compliant	4
6	17	11	8	2024-05-15	Non-Compliant	7
7	20	14	5	2024-06-05	Non-Compliant	8
8	23	17	3	2024-01-03	Non-Compliant	5
9	25	19	12	2024-03-12	Non-Compliant	7
10	27	20	18	2024-05-18	Non-Compliant	1
11	30	16	13	2024-02-10	Non-Compliant	4
12	33	13	3	2024-05-20	Non-Compliant	7
13	37	9	9	2024-02-05	Non-Compliant	10
14	40	6	16	2024-05-11	Non-Compliant	12
15	43	3	15	2024-03-01	Non-Compliant	5
16	45	1	17	2024-05-30	Non-Compliant	7

Total rows: 17 of 17 Query complete 00:00:00.225 Ln 2, Col 41

## 15. List the total budget and actual cost for each project.

The screenshot shows a PostgreSQL IDE interface. On the left is the Object Explorer with a tree view of the database schema. The 'participants' table is selected. The main window displays a SQL query in the 'Query' tab:

```
1 SELECT ProjectID, SUM(BudgetedCost) AS TotalBudget, SUM(ActualCost) AS TotalActualCost
2 FROM CostsAndBudgets
3 GROUP BY ProjectID;
```

The 'Data Output' tab shows the results of the query as a table with 10 rows:

	projectid integer	totalbudget numeric	totalactualcost numeric
1	8	3315000.00	3265000.00
2	10	3465000.00	3435000.00
3	9	3400000.00	3350000.00
4	7	3225000.00	3175000.00
5	1	2950000.00	2855000.00
6	5	3040000.00	2985000.00
7	4	2975000.00	2910000.00
8	2	3145000.00	3088000.00
9	6	3130000.00	3075000.00
10	3	3050000.00	2989000.00

The status bar at the bottom indicates: Total rows: 10 of 10 Query complete 00:00:00.170 Ln 4, Col 1

## 16. Find all communications marked as 'Unread'

The screenshot shows the same PostgreSQL IDE interface. The 'communication' table is selected in the Object Explorer. The main window displays a SQL query in the 'Query' tab:

```
1 SELECT CommunicationID, ProjectID, ParticipantID, Date, Message
2 FROM Communication
3 WHERE StatusID = (SELECT StatusID FROM Status WHERE StatusDescription = 'Unread');
```

The 'Data Output' tab shows the results of the query as a table with 5 rows:

	communicationid [PK] integer	projectid integer	participantid integer	date date	message text
1	1	5	120	2024-11-01	Initial project briefing.
2	12	11	220	2024-11-08	Safety equipment check.
3	21	12	20	2024-11-13	Finalized budget allocation.
4	28	2	55	2024-11-17	Site access issue resolution.
5	44	6	175	2024-11-25	Inspection review complete..

The status bar at the bottom indicates: Total rows: 5 of 5 Query complete 00:00:00.158 Ln 4, Col 1

## 17. List projects along with their locations

The screenshot shows the SQL Enterprise Manager interface. On the left, the Object Explorer displays the database structure, with the 'projects' table highlighted under the 'Tables (17)' folder. The main query window contains the following SQL code:

```

1 SELECT Projects.ProjectID, ProjectName, Locations.LocationName
2 FROM Projects
3 JOIN Locations ON Projects.LocationID = Locations.LocationID;
4

```

The Data Output pane shows the results of the query, displaying 16 rows of project data with their corresponding location names.

projectid	projectname	locationname
1	Residential Complex Phase I	Midtown Area
2	Highway Expansion Project	Industrial Zone

Total rows: 20 of 20 Query complete 00:00:00.138 Ln 4, Col 1

## 18. Get the count of communications by status for each project.

The screenshot shows the SQL Enterprise Manager interface. On the left, the Object Explorer displays the database structure, with the 'communication' table highlighted under the 'Tables (17)' folder. The main query window contains the following SQL code:

```

1 SELECT ProjectID, StatusDescription, COUNT(*) AS CommunicationCount
2 FROM Communication
3 JOIN Status ON Communication.StatusID = Status.StatusID
4 GROUP BY ProjectID, StatusDescription;
5

```

The Data Output pane shows the results of the query, displaying 16 rows of communication data, including the count of communications for each project and status combination.

projectid	statusdescription	communicationcount
1	Escalated	1
2	Follow-up Required	1
3	Replied	1
4	Replied	1
5	Follow-up Required	2
6	Replied	1

14	Closed	1
15	Escalated	1
16	Flagged	2

Total rows: 46 of 46 Query complete 00:00:00.119 Ln 5, Col 1

## 19. List projects where inspections resulted in more than one type of outcome.

The screenshot shows the PostgreSQL IDE interface. On the left, the Object Explorer displays the database schema, with the 'inspections' table highlighted under the 'Tables (17)' category. The main query editor contains the following SQL query:

```
1 SELECT ProjectID
2 FROM Inspections
3 GROUP BY ProjectID
4 HAVING COUNT(DISTINCT Result) > 1;
```

The Data Output pane shows the results of the query, displaying a table with two columns: 'projectid' (integer) and 'count' (integer). The results are as follows:

projectid	count
1	1
2	7
3	10
4	14
5	18
6	20

The status bar at the bottom indicates 'Total rows: 6 of 6', 'Query complete 00:00:00.125', and 'Ln 5, Col 1'.

## 20. List All Projects with Completed Inspections and Their Results

The screenshot shows the PostgreSQL IDE interface. On the left, the Object Explorer displays the database schema, with the 'inspections' table highlighted under the 'Tables (17)' category. The main query editor contains the following SQL query:

```
1 SELECT p.ProjectName, i.Date, ins.InspectorName, i.Result, i.Comments
2 FROM Projects p
3 JOIN Inspections i ON p.ProjectID = i.ProjectID
4 JOIN Inspectors ins ON i.InspectorID = ins.InspectorID
5 WHERE i.Result = 'Pass';
```

The Data Output pane shows the results of the query, displaying a table with five columns: 'projectname' (character varying (255)), 'date' (date), 'inspectorname' (character varying (255)), 'result' (character varying (50)), and 'comments' (text). The results are as follows:

projectname	date	inspectorname	result	comments
Residential Complex Phase I	2024-11-01	Emily Davis	Pass	Initial inspection completed successfully.
Highway Expansion Project	2024-11-12	Akhay Solanki	Pass	Final inspection before approval.
Highway Expansion Project	2024-11-02	Emily Riley	Pass	Safety compliance verified.
Metro Line Extension	2024-11-04	Jane Smith	Pass	Material quality standards met.
Shopping Mall Development	2024-11-15	Peter Pan	Pass	Safety measures confirmed post adjustm...
Shopping Mall Development	2024-11-05	Manish Malhotra	Pass	Site inspection passed.
School Campus Construction	2024-11-17	Jonathan Derby	Pass	Routine inspection completed.
School Campus Construction	2024-11-06	John Doe	Pass	Equipment calibration verified.
Luxury Apartment Tower	2024-11-18	Bruce Wayne	Pass	Electrical re-inspection approved.
Healthcare Facility	2024-11-08	Jonathan Smith	Pass	Environmental standards met.
Industrial Park Development	2024-11-09	Omi Puri	Pass	Material storage verified for compliance.
Airport Terminal Expansion	2024-11-10	Jane Smith	Pass	Structural integrity validated.
Hydroelectric Dam Construction	2024-11-12	Akhay Solanki	Pass	Plumbing connections inspected and appr...
IT Park Development	2024-11-13	Emily Riley	Pass	Quality check passed for concrete works.
Green Housing Project	2024-11-21	Emily Davis	Pass	Final approval after corrections.
Urban Revitalization	2024-11-25	Jonathan Smith	Pass	Final inspection passed.

The status bar at the bottom indicates 'Total rows: 22 of 22', 'Query complete 00:00:00.091', and 'Ln 5, Col 23'.

## 21. List Monitoring Tools Used in Each Project with Measurement Type

The screenshot shows the SQL Server Enterprise Manager interface. The Object Explorer on the left displays the database structure, with the 'monitoringtools' table selected. The central pane shows a query window with the following SQL query:

```
SELECT p.ProjectName, mt.ToolName, mt.MeasurementType, tp.MeasurementValue, tp.Unit
FROM Projects p
JOIN Tool_Project tp ON p.ProjectID = tp.ProjectID
JOIN MonitoringTools mt ON tp.ToolID = mt.ToolID;
```

The Data Output pane displays the results of the query, showing 16 rows of data. The columns are: projectName, toolname, measurementtype, measurementvalue, and unit.

projectname	toolname	measurementtype	measurementvalue	unit
Residential Complex Phase I	Total Station	Distance/Angle Measurement	150.50	meters
Residential Complex Phase I	Theodolite	Angle Measurement	28.20	degrees
Highway Expansion Project	Leveling Instrument	Height Measurement	32.80	centimeters
Corporate Office Park	GPS Equipment	Location Tracking	70.90	square meters
Corporate Office Park	Drones	Aerial Surveying	1.20	hours
Metro Line Extension	Laser Scanner	3D Data Capture	4.50	percent
Shopping Mall Development	Moisture Meter	Moisture Content	15.80	degrees Celsius
Shopping Mall Development	Thermal Imaging Camera	Heat Measurement	22.00	units
School Campus Construction	Concrete Maturity Sensor	Concrete Curing Monitoring	12.80	percentage
School Campus Construction	Vibration Monitor	Vibration Measurement	28.00	meters
Luxury Apartment Tower	Load Cell	Weight Measurement	1750.80	kg
Healthcare Facility	Environmental Sensor	Air Quality Monitoring	18.80	degrees Celsius
Industrial Park Development	Camera System	Security Monitoring	4.80	days
Airport Terminal Expansion	Smartphone Application	Site Management	60.90	units
Solar Power Plant	Quality Control Test Equipment	Material Testing	8.00	meters
Hydroelectric Dam Construction	BIM Software	Building Information Monitoring	50.90	units

Total rows: 63 of 63 Query complete 00:00:00.122 Ln 4, Col 16

## 22. Find Inspectors and Number of Inspections They Conducted

The screenshot shows the SQL Server Enterprise Manager interface. The Object Explorer on the left displays the database structure, with the 'inspectors' table selected. The central pane shows a query window with the following SQL query:

```
SELECT i.InspectorName, COUNT(ins.InspectionID) AS TotalInspections
FROM Inspections i
JOIN Inspectors ins ON i.InspectorID = ins.InspectorID
GROUP BY i.InspectorName;
```

The Data Output pane displays the results of the query, showing 12 rows of data. The columns are: InspectorName and totalinspections.

InspectorName	totalinspections
Emily Davis	3
Bruce Wayne	2
Dinesh Solanki	3
Johnson Derby	2
Om Puri	2
John Doe	2
Peter Pan	2
Akhay Solanki	3
Jane Smith	3
Marish Malhotra	2
Jonathan Smith	3
Emily Riley	3

Total rows: 12 of 12 Query complete 00:00:00.137 Ln 5, Col 1

## 23. Display Materials Availability Status for Each Project

The screenshot shows the PostgreSQL IDE interface. The Object Explorer on the left lists the database schema, with 'participants' highlighted. The main query editor contains the following SQL:

```

1 SELECT p.ProjectName, m.MaterialName, mp.AvailabilityStatus
2 FROM Projects p
3 JOIN Material_Project mp ON p.ProjectID = mp.ProjectID
4 JOIN Materials m ON mp.MaterialID = m.MaterialID;
5

```

The Data Output pane at the bottom displays the results of the query as a table with 16 rows and 3 columns: projectname, materialname, and availabilitystatus.

projectname	materialname	availabilitystatus
Corporate Office Park	Concrete	In Stock
Shopping Mall Development	Steel	Out of Stock
Luxury Apartment Tower	Wood	Reserved
Residential Complex Phase I	Brick	Low Stock
Industrial Park Development	Cement	In Use
Highway Expansion Project	Glass	Under Inspection
Metro Line Extension	Aluminum	Damaged
School Campus Construction	Asphalt	Reserved
Healthcare Facility	Stone	In Stock
Airport Terminal Expansion	Gypsum	Low Stock
Hydroelectric Dam Construction	Fiberglass Insulation	In Use
Green Housing Project	Plywood	Under Inspection
Railway Station Upgrade	Tile	Out of Stock
Public Park Renovation	Rebar	Reserved
University Campus Expansion	Paint	Damaged
Solar Power Plant	Drywall	In Stock

Total rows: 50 of 50 Query complete 00:00:00.125 Ln 5, Col 1

## 24. Retrieve the number of communications with each unique status across all projects:

The screenshot shows the PostgreSQL IDE interface. The Object Explorer on the left lists the database schema, with 'participants' highlighted. The main query editor contains the following SQL:

```

1 SELECT s.StatusDescription, COUNT(c.CommunicationID) AS CommunicationCount
2 FROM Communication c
3 JOIN Status s ON c.StatusID = s.StatusID
4 GROUP BY s.StatusDescription;
5

```

The Data Output pane at the bottom displays the results of the query as a table with 10 rows and 2 columns: statusdescription and communicationcount.

statusdescription	communicationcount
Action Taken	5
Flagged	3
Replied	7
Pending Review	5
Escalated	5
Unread	5
Read	5
Follow-up Required	6
Closed	5
Archived	4

Total rows: 10 of 10 Query complete 00:00:00.305 Ln 5, Col 1

25. List the latest inspection date for each project and the result of that inspection.

The screenshot shows the PostgreSQL IDE interface. On the left, the Object Explorer displays the database schema, with the 'inspections' table highlighted under the 'participants' schema. The main query editor displays the following SQL query:

```
1 SELECT i.ProjectID, MAX(i.Date) AS LatestInspectionDate, i.Result
2 FROM Inspections i
3 GROUP BY i.ProjectID, i.Result
4 ORDER BY i.ProjectID;
```

The Data Output pane shows the results of the query, displaying 16 rows. The columns are 'projectid' (integer), 'latestinspectiondate' (date), and 'result' (character varying (30)).

projectid	latestinspectiondate	result
1	2024-11-01	Pass
2	2024-11-10	Fail
3	2024-11-12	Pass
4	2024-11-03	Fail
5	2024-11-04	Pass
6	2024-11-15	Pass
7	2024-11-17	Pass
8	2024-11-07	Fail
9	2024-11-18	Pass
10	2024-11-08	Pass
11	2024-11-09	Pass
12	2024-11-10	Pass
13	2024-11-20	Fail
14	2024-11-11	Fail
15	2024-11-12	Pass
16	2024-11-13	Pass

Total rows: 26 of 26 Query complete 00:00:00.180 Ln 5, Col 1

26. Find the latest start date of any project within each location.

The screenshot shows the PostgreSQL IDE interface. On the left, the Object Explorer displays the database schema, with the 'locations' table highlighted under the 'participants' schema. The main query editor displays the following SQL query:

```
1 SELECT l.LocationName, MAX(p.StartDate) AS LatestProjectStartDate
2 FROM Projects p
3 JOIN Locations l ON p.LocationID = l.LocationID
4 GROUP BY l.LocationName;
```

The Data Output pane shows the results of the query, displaying 16 rows. The columns are 'locationname' (character varying (255)) and 'latestprojectstartdate' (date).

locationname	latestprojectstartdate
Retail District	2023-04-20
Downtown Area	2023-05-18
Heritage Area	2023-06-01
Logistics Park	2024-05-01
Business District	2024-06-10
Green Park	2023-10-15
North West Suburb	2023-03-25
Suburban Area	2024-09-20
East Side Technology Park	2024-03-12
Uptown Area	2023-02-10
West End Commercial Hub	2024-02-10
Industrial Zone	2023-03-01
Mixed-Use Development A...	2023-11-01
Residential Zone A	2023-09-05
Downtown Renewal Area	2023-07-12
Midtown Area	2023-01-15

Total rows: 20 of 20 Query complete 00:00:00.108 Ln 5, Col 1

27. List inspectors who have performed inspections on at least 3 different projects:

The screenshot shows the SQL Studio interface with the following query in the Query Editor:

```

1 SELECT i.InspectorID, insp.InspectorName, COUNT(DISTINCT i.ProjectID) AS ProjectCount
2 FROM Inspections i
3 JOIN Inspectors insp ON i.InspectorID = insp.InspectorID
4 GROUP BY i.InspectorID, insp.InspectorName
5 HAVING COUNT(DISTINCT i.ProjectID) >= 3;
6
7

```

The Data Output pane displays the results of the query:

InspectorID	InspectorName	ProjectCount
1	Jane Smith	3
2	Emily Davis	3
3	Jonathan Smith	3
4	Emily Riley	3
5	Akash Solanki	3
6	Dinesh Solanki	3

At the bottom, a status bar indicates: "Total rows: 6 of 6 Query complete 00:00:00.091 Ln 5, Col 40". A green message box at the bottom right states: "Successfully run. Total query runtime: 91 msec. 6 rows affected."

28. List projects and their participants who have pending communication:

The screenshot shows the SQL Studio interface with the following query in the Query Editor:

```

1 SELECT p.ProjectID, p.ProjectName, part.Name AS ParticipantName
2 FROM Projects p
3 JOIN Communication c ON p.ProjectID = c.ProjectID
4 JOIN Status s ON c.StatusID = s.StatusID
5 JOIN Participants part ON c.ParticipantID = part.ParticipantID
6 WHERE s.StatusDescription = 'Pending Review'
7 ORDER BY p.ProjectID;

```

The Data Output pane displays the results of the query:

ProjectID	ProjectName	ParticipantName
1	Shopping Mall Development	Robin Tunney
2	Industrial Park Development	Simon Rex
3	Industrial Park Development	Jason Cope
4	Hydroelectric Dam Construction	Freya Tingley
5	Urban Revitalization	Burt Young

At the bottom, a status bar indicates: "Total rows: 5 of 5 Query complete 00:00:00.114 Ln 7, Col 22". A green message box at the bottom right states: "Successfully run. Total query runtime: 114 msec. 5 rows affected."

29. Identify projects with the highest material costs, including both budgeted and actual costs, and categorize them by client.

The screenshot shows a PostgreSQL IDE with a query window and a data output table. The query is as follows:

```

1 SELECT p.ProjectID, p.ProjectName, c.ClientName,
2       SUM(cb.BudgetedCost) AS TotalBudgetedCost,
3       SUM(cb.ActualCost) AS TotalActualCost
4 FROM Projects p
5 JOIN CostsAndBudgets cb ON p.ProjectID = cb.ProjectID
6 JOIN Clients c ON p.ClientID = c.ClientID
7 GROUP BY p.ProjectID, p.ProjectName, c.ClientName
8 HAVING SUM(cb.BudgetedCost) > 500000
9 ORDER BY SUM(cb.ActualCost) DESC;
10

```

The data output table shows the following results:

projectid	projectname	clientname	totalbudgetedcost	totalactualcost
1	10	Airport Terminal Expansion	3485000.00	3435000.00
2	9	Industrial Park Development	3400000.00	3350000.00
3	8	Healthcare Facility	3315000.00	3265000.00
4	7	Luxury Apartment Tower	3225000.00	3175000.00
5	2	Highway Expansion Project	3145000.00	3088000.00
6	6	School Campus Constructi...	3130000.00	3075000.00
7	3	Corporate Office Park	3050000.00	2989000.00
8	5	Shopping Mall Development	3040000.00	2985000.00
9	4	Metro Line Extension	2975000.00	2910000.00
10	1	Residential Complex Phase I	2950000.00	2855000.00

Total rows: 10 of 10 Query complete 00:00:00.264 Ln 10, Col 1

30. Find the top 3 inspectors with the most inspections on projects that are currently "In Progress".

The screenshot shows a PostgreSQL IDE with a query window and a data output table. The query is as follows:

```

1 SELECT insp.InspectorID, insp.InspectorName, COUNT(i.InspectionID) AS TotalInspections
2 FROM Inspections i
3 JOIN Inspectors insp ON i.InspectorID = insp.InspectorID
4 JOIN Projects p ON i.ProjectID = p.ProjectID
5 WHERE p.Status = 'In Progress'
6 GROUP BY insp.InspectorID, insp.InspectorName
7 ORDER BY COUNT(i.InspectionID) DESC
8 LIMIT 3;
9

```

The data output table shows the following results:

InspectorID	InspectorName	totalinspections
9	Manish Malhotra	2
4	Johnson Derby	1
3	Emily Davis	1

Total rows: 3 of 3 Query complete 00:00:00.121 Ln 1, Col 1

31. Get the communication status and total count of replies for each participant in a specific project.

The screenshot shows the SQL Server Enterprise Manager interface. The Object Explorer on the left displays the database schema, with the 'participants' table highlighted. The main query window shows the following SQL query:

```

1 SELECT part.Name AS ParticipantName, s.StatusDescription, COUNT(c.CommunicationID) AS MessageCount
2 FROM Communication c
3 JOIN Status s ON c.StatusID = s.StatusID
4 JOIN Participants part ON c.ParticipantID = part.ParticipantID
5 WHERE c.ProjectID = 7
6 GROUP BY part.Name, s.StatusDescription
7 ORDER BY MessageCount DESC;

```

The Data Output pane shows the results of the query:

	participantname	statusdescription	messagecount
1	Adam Garcia	Read	1
2	Nona Gaye	Read	1
3	Piper Perabo	Closed	1

The status bar at the bottom indicates: Total rows: 3 of 3. Query complete 00:00:00.107. Ln 5, Col 22. A green message box states: Successfully run. Total query runtime: 107 msec. 3 rows affected.

32. Find the total budgeted and actual costs for all projects, grouped by client, and identify the client with the largest cost difference.

The screenshot shows the SQL Server Enterprise Manager interface. The Object Explorer on the left displays the database schema, with the 'participants' table highlighted. The main query window shows the following SQL query:

```

1 SELECT c.ClientName,
2        SUM(cb.BudgetedCost) AS TotalBudgetedCost,
3        SUM(cb.ActualCost) AS TotalActualCost,
4        (SUM(cb.ActualCost) - SUM(cb.BudgetedCost)) AS CostDifference
5 FROM Clients c
6 JOIN Projects p ON c.ClientID = p.ClientID
7 JOIN CostsAndBudgets cb ON p.ProjectID = cb.ProjectID
8 GROUP BY c.ClientName
9 ORDER BY CostDifference DESC
10 LIMIT 1;

```

The Data Output pane shows the results of the query:

	clientname	totalbudgetedcost	totalactualcost	costdifference
1	Rajiv Gandhi International Airport	3315000.00	3265000.00	-50000.00

The status bar at the bottom indicates: Total rows: 1 of 1. Query complete 00:00:00.117. Ln 11, Col 1.

33. Find the top 3 materials with the highest number of quality checks across all projects.

The screenshot shows the PostgreSQL IDE interface. The Object Explorer on the left lists the database schema, with 'materials' selected. The main query window displays the following SQL query:

```

1 SELECT m.MaterialName, COUNT(qa.CheckID) AS TotalChecks
2 FROM Materials m
3 JOIN QualityAssurance qa ON m.MaterialID = qa.MaterialID
4 GROUP BY m.MaterialName
5 ORDER BY TotalChecks DESC
6 LIMIT 3;

```

The Data Output pane shows the results of the query:

	materialname character varying (255)	totalchecks bigint
1	Cement	4
2	Wood	3
3	Asphalt	3

A status message at the bottom indicates: "Successfully run. Total query runtime: 103 msec. 3 rows affected."

34. Find the most commonly used tools for each project (based on the number of times they are used).

The screenshot shows the PostgreSQL IDE interface. The Object Explorer on the left lists the database schema, with 'monitoringtools' selected. The main query window displays the following SQL query:

```

1 SELECT p.ProjectID, p.ProjectName, t.ToolName, COUNT(tp.ToolID) AS ToolUsageCount
2 FROM Projects p
3 JOIN Tool_Project tp ON p.ProjectID = tp.ProjectID
4 JOIN MonitoringTools t ON tp.ToolID = t.ToolID
5 GROUP BY p.ProjectID, p.ProjectName, t.ToolName
6 ORDER BY ToolUsageCount DESC;

```

The Data Output pane shows the results of the query:

	projectid integer	projectname character varying (255)	toolname character varying (255)	toolusagecount bigint
1	1	Residential Complex Phase I	Theodolite	3
2	2	Highway Expansion Project	Leveling Instrument	3
3	3	Corporate Office Park	GPS Equipment	3
4	7	Luxury Apartment Tower	Load Cell	2
5	6	School Campus Construction	Moisture Meter	2
6	8	Healthcare Facility	Environmental Sensor	2
7	10	Airport Terminal Expansion	Smartphone Application	2
8	6	School Campus Construction	Vibration Monitor	2
9	11	Solar Power Plant	Quality Control Test Equipment	2
10	7	Luxury Apartment Tower	Thermal Imaging Camera	2
11	9	Industrial Park Development	Camera System	2
12	4	Metro Line Extension	Drones	2
13	5	Shopping Mall Development	Laser Scanner	2
14	9	Industrial Park Development	Vibration Monitor	1
15	3	Corporate Office Park	Moisture Meter	1
16	10	Airport Terminal Expansion	Load Cell	1

A status message at the bottom indicates: "Total rows: 47 of 47 Query complete 00:00:00.120 Ln 7, Col 1"

35. Get a list of projects with the number of participants and the total cost for each project.

The screenshot shows the PostgreSQL IDE interface. On the left, the 'Object Explorer' pane displays the database schema, with 'participants' highlighted under the 'Tables (17)' category. The main query editor contains the following SQL query:

```

1 SELECT p.ProjectID, p.ProjectName,
2       COUNT(DISTINCT pt.ParticipantID) AS ParticipantCount,
3       SUM(cb.ActualCost) AS TotalCost
4 FROM Projects p
5 JOIN Participants pt ON p.ProjectID = pt.ProjectID
6 JOIN CostsAndBudgets cb ON p.ProjectID = cb.ProjectID
7 GROUP BY p.ProjectID, p.ProjectName
8 ORDER BY ParticipantCount DESC, TotalCost DESC;

```

The 'Data Output' pane shows the results of the query:

projectid [PK] integer	projectname character varying (255)	participantcount bigint	totalcost numeric
1	4 Metro Line Extension	69	200790000.00
2	7 Luxury Apartment Tower	37	117475000.00
3	5 Shopping Mall Development	35	104475000.00
4	1 Residential Complex Phase I	34	97070000.00
5	3 Corporate Office Park	33	986376000.00
6	9 Industrial Park Development	32	107200000.00
7	6 School Campus Constructi...	32	98400000.00
8	2 Highway Expansion Project	28	86464000.00

Total rows: 8 of 8 Query complete 00:00:00.139 Ln 5, Col 18

36. Find the number of materials checked for compliance in each project

The screenshot shows the PostgreSQL IDE interface. On the left, the 'Object Explorer' pane displays the database schema, with 'materials' highlighted under the 'Tables (17)' category. The main query editor contains the following SQL query:

```

1 SELECT p.ProjectID, p.ProjectName,
2       COUNT(DISTINCT qa.MaterialID) AS MaterialsCheckedForCompliance
3 FROM Projects p
4 LEFT JOIN QualityAssurance qa ON p.ProjectID = qa.ProjectID
5 GROUP BY p.ProjectID, p.ProjectName
6 ORDER BY MaterialsCheckedForCompliance DESC;

```

The 'Data Output' pane shows the results of the query:

projectid [PK] integer	projectname character varying (255)	materialscheckedforcompliance bigint
1	5 Shopping Mall Development	4
2	3 Corporate Office Park	4
3	1 Residential Complex Phase I	4
4	4 Metro Line Extension	4
5	9 Industrial Park Development	3
6	2 Highway Expansion Project	3
7	12 Hydroelectric Dam Construction	2
8	13 IT Park Development	2
9	14 Green Housing Project	2
10	15 Urban Revitalization	2
11	16 Railway Station Upgrade	2
12	17 Residential Tower Complex	2
13	19 Suburban Housing Development	2
14	20 University Campus Expansion	2
15	6 School Campus Construction	2
16	7 Luxury Apartment Tower	2

Total rows: 20 of 20 Query complete 00:00:00.280 Ln 7, Col 1

37. Get the projects with the highest number of inspections that passed.

The screenshot shows the SQL Server Enterprise Manager interface. The Object Explorer on the left shows the database structure. The central pane displays a query in the Query Editor:

```

1 SELECT p.ProjectID, p.ProjectName, COUNT(i.InspectionID) AS PassedInspections
2 FROM Projects p
3 JOIN Inspections i ON p.ProjectID = i.ProjectID
4 WHERE i.Result = 'Pass'
5 GROUP BY p.ProjectID, p.ProjectName
6 ORDER BY PassedInspections DESC;
7

```

The Data Output pane shows the results of the query:

projectid	projectname	passedinspections
6	School Campus Construction	2
2	Highway Expansion Project	2
15	Urban Revitalization	2
5	Shopping Mall Development	2
9	Industrial Park Development	1
10	Airport Terminal Expansion	1
12	Hydroelectric Dam Construction	1
13	IT Park Development	1
14	Green Housing Project	1
16	Railway Station Upgrade	1
17	Residential Tower Complex	1
18	Public Park Renovation	1
19	Suburban Housing Development	1
1	Residential Complex Phase I	1
20	University Campus Expansion	1
4	Metro Line Extension	1

Total rows: 18 of 18. Query complete 00:00:00.138 Ln 7, Col 1

38. Get a summary of the cost breakdown for each project by category.

The screenshot shows the SQL Server Enterprise Manager interface. The Object Explorer on the left shows the database structure. The central pane displays a query in the Query Editor:

```

1 SELECT p.ProjectID, p.ProjectName, c.CategoryName, SUM(cb.ActualCost) AS TotalCategoryCost
2 FROM Projects p
3 JOIN CostsAndBudgets cb ON p.ProjectID = cb.ProjectID
4 JOIN Categories c ON cb.CategoryID = c.CategoryID
5 GROUP BY p.ProjectID, p.ProjectName, c.CategoryName
6 ORDER BY p.ProjectID, c.CategoryName;
7

```

The Data Output pane shows the results of the query:

projectid	projectname	categoryname	totalcategorycost
1	Residential Complex Phase I	Electrical Work	95000.00
2	Residential Complex Phase I	Equipment Rental	195000.00
3	Residential Complex Phase I	Labor Costs	145000.00
4	Residential Complex Phase I	Material Costs	290000.00
5	Residential Complex Phase I	Permits and Licenses	175000.00
6	Residential Complex Phase I	Plumbing	480000.00
7	Residential Complex Phase I	Safety Equipment	730000.00
8	Residential Complex Phase I	Site Preparation	240000.00
9	Residential Complex Phase I	Structural Work	390000.00
10	Residential Complex Phase I	Subcontractor Fees	115000.00
11	Highway Expansion Project	Electrical Work	108000.00
12	Highway Expansion Project	Equipment Rental	210000.00
13	Highway Expansion Project	Labor Costs	170000.00
14	Highway Expansion Project	Material Costs	315000.00
15	Highway Expansion Project	Permits and Licenses	190000.00
16	Highway Expansion Project	Plumbing	525000.00

Total rows: 100 of 100. Query complete 00:00:00.276 Ln 7, Col 1

39. Find the most frequent communication status for each project.

The screenshot shows the SQL Server Enterprise Manager interface. The Object Explorer on the left shows the 'conDB' database with various tables. The 'participants' table is selected. The Query window shows the following SQL query:

```

1 SELECT p.ProjectID, p.ProjectName, s.StatusDescription, COUNT(c.CommunicationID) AS StatusCount
2 FROM Projects p
3 JOIN Communication c ON p.ProjectID = c.ProjectID
4 JOIN Status s ON c.StatusID = s.StatusID
5 GROUP BY p.ProjectID, p.ProjectName, s.StatusDescription
6 ORDER BY StatusCount DESC;

```

The Data Output window shows the results of the query:

projectid	ProjectName	statusdescription	statuscount
14	Green Housing Project	Follow-up Required	2
10	Suburban Housing Development	Flagged	2
9	Industrial Park Development	Pending Review	2
7	Luxury Apartment Tower	Read	2
2	Highway Expansion Project	Replied	1
14	Green Housing Project	Replied	1
9	Industrial Park Development	Replied	1
20	University Campus Expansion	Archived	1
10	Airport Terminal Expansion	Flagged	1
18	Public Park Renovation	Action Taken	1
13	IT Park Development	Closed	1
6	School Campus Construction	Escalated	1
17	Residential Tower Complex	Follow-up Required	1
16	Railway Station Upgrade	Archived	1
15	Urban Revitalization	Read	1
10	Airport Terminal Expansion	Action Taken	1

Total rows: 46 of 46 Query complete 00:00:00.280 Ln 7, Col 1

40. Find the total quantity of each material used across all projects.

The screenshot shows the SQL Server Enterprise Manager interface. The Object Explorer on the left shows the 'conDB' database with various tables. The 'materials' table is selected. The Query window shows the following SQL query:

```

1 SELECT m.MaterialName, SUM(mp.Quantity) AS TotalQuantityUsed
2 FROM Materials m
3 JOIN Material_Project mp ON m.MaterialID = mp.MaterialID
4 GROUP BY m.MaterialName
5 ORDER BY TotalQuantityUsed DESC;

```

The Data Output window shows the results of the query:

materialname	totalquantityused
Glass	2770
Asphalt	2540
Tile	2470
Brick	2420
Paint	2390
Wood	2360
Stone	2090
Fiber Cement Board	1940
Fiberglass Insulation	1820
Aluminum	1780
Cement	1560
Drywall	1510
Gypsum	1480
Steel	1440
PVC	1300
Aggregate	1150

Total rows: 20 of 20 Query complete 00:00:00.109 Ln 6, Col 1

## **Chapter 5:** Interface Implementation

## Setup JDBC and Basic GUI

### STEP 1

Our PostgreSQL Tables already exist in the Database "Conn\_DB". Hence, No need to create them again.

### STEP 2

JDK Already Installed on the System.

PostgreSQL JDBC driver (postgresql-42.7.4.jar) downloaded from the <https://jdbc.postgresql.org/download/>.

### STEP 3

A New Project Directory was created called "postgreSQLCRUDApp" with sub-directory "src" for the JAVA Code.

The JAR file of JDBC postgresQL Driver moved to src Folder.

### STEP 4

Java Code file created called "ProjectManagement.java".

Code written to Create a Basic GUI and perform CRUD (Create,Read,Update,Delete) Operations

## **CRUD Operation on GUI**

### **Tables:**

1. Projects (ProjectID, ProjectName, StartDate, Enddate, ClientID, LocationID, Stats)
2. Clients (ClientID, ClientName, ContactInfo)
3. Locations ( LocationID, LocationName)

# CRUD Operations

## 1. Add Project

## **Chapter 6:** Technical Issues and Solution

## Technical Issues and Their Solution

### Problem 1: Lack of Familiarity with Java Programming Language Syntax

#### Problem Statement:

We actually had a huge problem with Java because we were not familiar with its syntax and structure at least when faced with GUI development. We barely ever had a situation where we did not need to refer to some documentation, so we often faced unknown constructs, which caused delays and made the whole process much longer than it was supposed to be. This left us realizing how very important it was to have some basic understanding of Java before attempting complicated things.

#### Applied Solution

To counter this, we read documentation often and did exercises in debugging Java syntax. As a result, we gained familiarity with the language and its subtleties; this enabled us to incrementally work our way through the project. This exercise really went on to teach us how vitally important it is to conquer the basic principles of any programming language to successfully undertake highly technical tasks.

### Problem 2: Problem in Identifying Data to Populate the Tables

#### Problem Statement :

It proved to be quite challenging to find realistic, constraint-compliant data to insert into our tables, especially when we ran into foreign key dependencies with the constrained data making sure it fitted in our rather complex schema. It was quite a challenge at the early stages of our work in finding data that could satisfy the relational requirements of the schema and integrity constraints.

#### Applied Solution

We used Python together with the Pandas library to produce random datasets that had attributes and were weighted with an aim of ensuring real world conditions to be represented. This allowed us to populate the tables with diverse yet compliant data sets, although it took a fair amount of time and effort in ensuring consistency across relationships.

**Problem 3: Conversion of Database from 2NF to 3NF/BCNF****Problem Description:**

The design of our initial database was in 1NF and 2NF but had to be changed to 3NF and BCNF, involving checking every dependency that required an inquiry into every attribute. Thus, every attribute was scrutinized, transitive dependencies were determined, and all non-prime attributes were ensured to be fully dependent on the candidate keys, which was very time-consuming and difficult.

**Applied Solution**

We did much in terms of research and defined hypothetical test cases with which we tested our transformations. This led us to identify and address problems, validate our normalization work, and, most importantly, ensure that the database remained well-structured, efficient, and fully normalized up to the higher normal forms.

**Problem 4: Maintaining Referential Integrity Over Complex Foreign-Key Dependency****Problem Statement:**

This made our construction industry database contain many linked entities, and referential integrity turned out to be tough to enforce. The constraints of the foreign keys could not easily be broken during update and delete operations. Cascading updates were found to be one of the main obstacles in creating a complex relationship.

**Applied Solution :**

We also executed each transaction carefully enough to not leave behind orphaned records by mistake or integrity violations. With the ability to support cascading updates and rollbacks, we ensured that the integrity of the database was maintained with respect to interdependencies across multiple interdependencies. Testing this became vital to prevent referential integrity issues as the schema grew complex.

**Problem 5: Limited Domain Knowledge of the Construction Industry****Problem Description:**

It was something new to us, so we had to do a lot of research to understand the database requirements of this particular domain. This project threw open concepts that ranged from material tracking to participant management. This was time-consuming and felt like a heavy burden to carry.

**Applied Solution :**

This experience was through extensive research, which kept us familiarized with construction industry operations in terms of the interactions of various entities present in a construction site. This knowledge improved the effectiveness of our project and increased our practical expertise to enable us to gain a greater view of the applications in the real world.

**Issue 6: Niche Domain with Limited Background Resources****Problem Description:**

This domain of database management in the construction site is niche, with limited, fragmented resources available. Construction data management was among such niche domains which had very few cohesive references to refer from and thus gave rise to the problem of getting wholesome information.

**Applied Solution**

Littered literature and industry-specific studies were gathered as pieces of insights thereby piecing together a workable understanding of construction data requirements. This was an approach to overcome the lack of resources with a consolidated effort though it required additional effort to compile all relevant information.
